Structural study of Eu₄(MoO₄)₃ and Sm₄(MoO₄)₃ polymorphs

C. González-Platas, M. C. Guzmán-Afonso, E. M. Torres, J. González-Platas, E. Maténsanz, M. Castro, Ulises R. Rodríguez-Mendoza, Departamento de Física Fundamental y Experimental, Electrónica y Sistemas, Universidad Complutense de Madrid, Madrid (Spain).

Light RE molybdates (RE=La-Eu) can occur in two differently ordered scheelite-type (CaWO₄) structures: La₄(MoO₄)₃ [1] and α-Eu₄(MoO₄)₃ [2]. Intermediate molybdates (RE=Sm-Ho) show the β'-Gd₄(MoO₄)₃ ferroelectric-ferroelastic phase [3]. A sound knowledge of the dielectric and optical properties of RE₄(MoO₄)₃ crystals correlated with their crystal structure is of fundamental importance for the application of these materials. Sm and Eu molybdates are particularly interesting because both phases (α and β̂') are stable at room conditions [4], [5]. In this work, we have studied the evolution of the four phases (α, β', β̂ and amorphous) of Eu₄(MoO₄)₃ and Sm₄(MoO₄)₃ with the temperature, in order to explain a new anomaly detected in their dielectric permittivity and in the heat capacity around 275K. Such anomaly can be related with a phase transition between the ferroelectric phase β̂ and/or to the α phase, before the ferroelectric(β̂)-paraelectric(β̂') transition and the β-α transition at higher temperature. We have applied a new alternative method for treating distorted structures by means of symmetry mode analysis, performed using the program AMPLIMODES, developed in the Bilbao Crystallographic Server [6], and the Rietveld refinement of the amplitudes of such symmetry modes, instead of dealing with the atomic coordinates using the Fullprof program [7]. Moreover, the diffuse scattering has been analyzed and quantified to explain the dielectric and thermal anomalies.

Keywords: rare-earth molybdate, phase transition, polymorphism.

Recent developments at the ECHIDNA high-resolution neutron powder diffractometer

Maxim Aoudiev, James Hester, Bragg Institute, ANSTO, Sydney, (Australia). Email:max@ansto.gov.au

The ECHIDNA high-resolution neutron powder diffractometer at OPAL has been in routine and largely trouble-free operation for three years. Data from ECHIDNA have appeared in over 30 publications, covering a temperature range of 1.5K to 1900K and magnetic fields up to 7 T. ECHIDNA data reduction is largely automated, with a user-friendly interface and a wide choice of output formats (hdf, pdCIF, xyd, GSAS).

Data reduction implements a sophisticated approach to gain correction, described in a companion poster [1], and provides large amounts of metadata relating to the data reduction via the pdCIF output format.

The range of instrument configurations continues to expand. A low-temperature (<1K), cryogen-free top-loading cryostat is currently being commissioned and first results are reported. In addition, the maximum takeoff angle has been increased from 140 to 155 degrees without compromising our ability to use the robotic sample loader.

In addition to the regular calls for proposals twice a year, ECHIDNA operates a popular fast access mail-in program. In order to participate, applicants should fill in the simple web-based form accessed via http://neutron.ansto.gov.au. Following safety and technical review, applicants forward their samples to us and data are returned typically within one month of sample receipt. Mail-in sample environment is usually restricted to room temperature and/or 4K.

Keywords: powder diffraction, instrumentation, neutron.

High-Pressure Neutron Diffraction Study of Fe₄₃₃₄₄₅₁₅₆₇₄₅₀₆₇₄₅₁₅₆₇₄₅₀₆₇₄₅₁₅₆₇₄₅₀₆₇₄₅₁₅₆₇₄₅₀₆₇₄₅₁₅₆₇₄₅₀₆₇₄₅₁₅₆₇₄₅₀₆₇₄₅₁₅₆₇₄₅₀₆₇₄₅₁₅₆₇₄₅₀₆₇₄₅₁₅₆₇₄₅₀₆₇₄₅₁₅₆₇₄₅₀₆₇₄₅₁₅₆₇₄₅₀₆₇₄₅₁₅₆₇₄₅₀₆₇₄₅₁₅₆₇₄₅₀₆₇₄₅₁₅₆₇₄₅₀₆₇₄₅₁₅₆₇₄₅₀₆₇₄₅₁₅₆₇₄₅₀₆₇₄₅₁₅₆₇₄₅₀₆₇₄₅₁₅₆₇₄₅₀₆₇₄₅₁₅₆₇₄₅₀₆₇₄₅₁₅₆₇₄₅₀₆₇₄₅₁₅₆₇₄₅₀₆₇₄₅₁₅₆₇₄₅₀₆₇₄₅₁₅₆₇₄₅₀₆₇₄₅₁₅₆₇₄₅₀₆₇₄₅₁₅₆₇₄₅₀₆₇₄₅₁₅₆₇₄₅₀₆₇₄₅₁₅₆₇₄₅₀₆₇₄₅₁₅₆₇₄₅₀₆₇₄₅₁₅₆₇₄₅₀₆₇₄₅₁₅₆₇₄₅₀₆₇₄₅₁₅₆₇₄₅₀₆₇₄₅₁₅₆₇₄₅₀₆₇₄₅₁₅₆₇₄₅₀₆₇₄₅₁₅₆₇₄₅₀₆₇₄₅₁₅₆₇₄₅₀₆₇₄₅₁₅₆₇₄₅₀₆₇₄₅₁₅₆₇₄₅₀₆₇₄₅¹

High-Pressure Neutron Diffraction Study of Fe₄₃₃₄₄₅₁₅₆₇₄₅₀₆₇₄₅₁₅₆₇₄₅₀₆₇₄₅₁₅₆₇₄₅₀₆₇₄₅¹

Jens-Erik Jørgensen, Department of Chemistry, University of Aarhus, DK-8000 Aarhus C (Denmark). E-mail:jensrik@chem.au.dk

The crystal and magnetic structures of Fe₄₃₃₄₄₅₁₅₆₇₄₅₀₆₇₄₅¹ were studied at high pressures and low temperatures. The experiment was performed on the DMC diffractometer at the SINQ spallation source at Paul Scherrer Institut, Switzerland. The sample was loaded into a clamp type pressure-cell using Fluorinert as the pressure transmitting medium. NaCl was used as an internal standard for pressure calibration and the...

Ionic Liquids (ILs) are salts with melting points below 100°C, i.e. they are liquids comprised entirely of cations and anions. ILs exhibit a unique set of physical properties that make them interesting for different applications: non-volatility, high thermal stability, wide liquid-state temperature range, good solvents for synthesis, etc. [1]. In addition, ILs containing transition metal complexes show very interesting magnetic properties [2]. It is known that the physicochemical properties of the ILs can be tailored by the selection of both cation and anion components, but the origins of their unique behavior are still relatively poorly understood [3]. Previous studies demonstrate that a correlation exists between the structure of the ILs in the solid and liquid states. Therefore the elucidation of the crystal structures of these compounds would provide a strong basis from which the ILs properties can be further rationalized. ILs display very complicated thermal and crystallization behavior, such as supercooling and glass formation, pre-melting or solid-solid phase transitions [4]. Usually, ILs thermal behavior studies have been performed by differential scanning calorimetry but, to our knowledge, no thermodiffraction studies have been reported yet.

One of the most prominent cation-type is the N,N'-dialkylimidazolium. Their counterion may range from a simple halide to more sophisticated anions. We have investigated the thermal behavior of the magnetic room temperature ionic liquids (MRTIL) 1-ethyl-3-methylimidazolium tetrachloroferrate(II), EMIM[FeCl₄], and 1-butyl-3-methylimidazolium tetrachloroferrate(III), BMIM[FeCl₄], by using X-ray powder thermodiffraction and differential scanning calorimetry. EMIM[FeCl₄] displays thermal polymorphism and exhibits reversible and irreversible solid-solid crystalline transitions with the formation of metastable phases. On the other side, for BMIM[FeCl₄] homogeneous crystallization from the melt is inhibited and glass formation occurs on cooling. This amorphous solid crystallizes below room temperature by devitrification on heating from the cooled glassy state. Both systems show a very complex behavior with formation of metastable phases depending on the materials thermal histories.

Dynamic and crystallographic neutron studies of LaₓBaᵧGaO₄₊₂ₓ toward a better understanding of the proton diffusion in new fuel cell materials

Delphine Gout,³ Niina Jalarvo,⁴ Michael Obel,⁴ "Juelich Center for Neutron Science outstationed at SNS, Oak Ridge (USA). ²Oak Ridge National Laboratory, Oak Ridge (USA). E-mail: goudj@ornl.gov

Fuel cells convert chemical energy directly to electrical energy cleanly and efficiently. A crucial part of a fuel cell is the electrolyte, a material that conducts ions. On the way towards practicable solutions, one of the biggest problems at the moment is the lack of stable and effective ionic conductor at the desired intermediate temperature range (100-600°C). Solid oxide proton conductors present many advantages compared to the other candidates as they offer higher efficiency than conventional oxygen ion materials.

Novel oxide structures such as LaₓBaᵧGaO₄₊₂ₓ containing tetrahedral units and high proton and oxide ion conductivities have been shown to be potential candidates at intermediate temperatures [2,3]. Proton conductivity dominates in wet atmospheres below 700 °C, giving rise to as high protonic conductivity as 10⁻⁴ S cm⁻¹ at 500°C [3,4]. In these systems water can be incorporated into the structure as protonic defects from humid atmospheres. However, despite the importance of proton conduction for energy applications, our understanding of the complex mechanisms driving the proton transport is still not well understood [1].

High-resolution neutron powder diffraction as well as quasi-elastic measurements will be presented to highlight our knowledge of the migration/diffusion of protons into the material and therefore understand the dynamic of the phenomenon.
