Abstract. Tetracaesium tristrontium dihydrogentris(tetrametaphosphate), \( M_r = 1744.1 \), cubic, \( I43d \), \( a = 15.455 (5) \AA, \ V = 3691.5 \AA^3, \ Z = 4, \ D_x = 3.138 \text{Mg m}^{-3}, \lambda(\text{Ag Kα}) = 0.5608 \AA, \mu = 4.838 \text{mm}^{-1}, \ F(000) = 3216, \ T = 293 \text{K}, \text{ final } R = 0.031 \text{for 286 independent reflexions. This compound is the third example of a tetrametaphosphate in which the P–O framework observed in Al₄(P₄O₁₂)₃ remains unchanged, while associated cations have various distributions [Sr at 12(a), Cs at 16(c) \( x \approx 0.368 \)].}

Introduction. The crystal structure of aluminum tetrametaphosphate, \( \text{Al}_4(P_4O_{12})_3 \), was described as early as 1937 (Pauling & Sherman, 1937). This type of structure was later refined by Bagieu-Beucher & Guitel (1978) using the isotypic Sc salt: \( \text{Sc}_4(P_4O_{12})_3 \). Recently Averbuch-Pouchot & Durif (1983) described a series of tetrametaphosphates: \( \text{MII}_4\text{INa}_4(P_4O_{12})_3 \) (MII--Zn, Co, Ni, Mg) in which they observed a P–O framework identical to that of the Al salt, but with a very different distribution of the associated cations. The same observation was made by Rzaigui, Averbuch-Pouchot & Durif (1983) upon reinvestigating the crystal structure of a series of salts of general formula \( \text{Ln}_n\text{M'}_n\text{IP}_4\text{O}_{12} \). The title compound is the third example of a crystal structure in which the P–O framework of \( \text{Al}_4(P_4O_{12})_3 \) remains unchanged.

Experimental. During experiments to optimize the chemical preperations of the tetrametaphosphate–polyphosphate of Cs–Sr, \( \text{Sr}_2\text{Cs}_3(P_4O_{12})(PO_3)_3 \) (Averbuch-Pouchot, 1985a), and of the Cs–Pb polyphosphate \( \text{PbCs}_2(PO_3)_4 \) (Averbuch-Pouchot, 1985b) we frequently observed the formation of tetrahedra slightly soluble in water. This solubility proves that the compound is not a polyphosphate but probably a Cs-rich cyclophosphate. The structural analysis shows that this salt is \( \text{Cs}_4\text{Sr}_3\text{H}_2(P_4O_{12})_3 \). \( D_m \) not measured. Tetrahedral crystal (edge 0.14 mm). Philips PW 1100 diffractometer. Systematic absences: \( hkl, h + k + l = 2n; hh(l, 2h + l = 4n \). 16 reflexions \( (8 < \theta < 12^\circ) \) for refining the unit-cell dimensions. \( \omega \) scan, scan width 1·20°, scan speed 0·02° s⁻¹. Total background measuring time 20 s. 1786 reflexions measured \( (3 < \theta < 25^\circ) \). \( H_{\text{max}} = K_{\text{max}} = L_{\text{max}} = 24 \). Intensity reference reflexions: 800 and 800. 416 independent reflexions \( (R_{\text{int}} = 0.017) \). Lorentz and polarization correction, no absorption correction. Structure determination by analogy with the other derivative compounds. Anisotropic full-matrix least-squares refinement (on \( F \)). Unit weights. Final refinements with 286 reflexions corresponding to \( F_o > 3\sigma_F \). Final \( R = 0.031 \) \( (wR = 0.030), S = 2.415 \). Max. \( \Delta/\sigma = 0.04 \) (scale factor).* Max. peak height in final difference Fourier 0.85 e Å⁻³. No extinction correction. Scattering factors for neutral atoms and \( f' \) and \( f'' \) from International Tables for X-ray Crystallography (1974). Enraf–Nonius (1977) SDP used for all calculations.

Discussion. The final atomic coordinates and \( B_{eq} \) values are reported in Table 1 while the main interatomic distances and bond angles are given in Table 2.

As suggested by the space group and the unit-cell parameter, the title compound is structurally very similar to some other types of tetrametaphosphates previously reported with various chemical formulas. We summarize some examples: Al₄(P₄O₁₂)₃, I₄₃d, a = 13.730 Å, Z = 4; Zn₄Na₄(P₄O₁₂)₃, I₄₃d, a = 14.57 Å, Z = 4; CeNH₄P₄O₁₂, I₄₃d, a = 15.23 Å, Z = 12. In these three types of compounds one observes that the P₄O₁₂ frameworks are strictly identical, but inside this framework the atomic distribution of the associated cations is very different. In the case of Al₄(P₄O₁₂)₃ the 16 Al atoms are located in an octahedral void with ternary symmetry [16(c) with x ~ 0.104]. For Zn₄Na₄(P₄O₁₂)₃, the associated cations are twice as numerous. The 16 Na atoms are located at 16(c) with x ~ 0.110 while the 16 Zn atoms occupy the same crystallographic position with x ~ 0.235. For CeNH₄P₄O₁₂ the 12 Ce atoms are located at position 2(b) while an equal number of ammonium groups statistically occupy position 16(c) (x ~ 0.112).

In the case of the title compound the twelve Sr atoms are at position 12(a) and the 16 Cs atoms at 16(c) (x ~ 0.368). The H atoms have not been located. Up to now no isotypic tetrametaphosphate is known for this compound.

Abstract. Strontium tellurate(VI), Mₓ = 279.22, Pbn, a = 5.605 (3), b = 13.181 (4), c = 5.003 (2) Å, V = 370 (1) Å³, Z = 4, Dₓ = 5-07 Mg m⁻³, λ(Mo Kα) = 0.7107 Å, μ = 22.01 mm⁻¹, F(000) = 488, T = 295 K, final R = 0-037 (wR = 0-033) for 488 reflections. Hydrothermal synthesis. The structure contains TeO₆ octahedra which share edges, thus forming infinite chains parallel to the c axis which are held together by Sr²⁺ ions. The structure is similar to the Pbn modification of Na₂TeO₄ (β form). In the monoclinic modification (α form) a relative motion of chains leads to the presence of two different types of channels and to different locations for the cations. An irreversible phase transition (953 K) changes the α form to the β.

Partie expérimentale. Synthèse hydrothermale à la température la plus basse possible (640 K): Sr(NO₃)₂ + Na₂TeO₄ → SrTeO₄ + NaNO₂ + NaNO₃. Recherche d’une éventuelle forme monoclinique semblable à Na₂TeO₄α (Daniel, Maurin, Moret & Philippot, 1977). Les courbes de calorimétrie différentielle à balayage des composés préparés à des pH différents ne permettent pas, pour le moment, d’envisager une autre variété que la forme orthorhombique de SrTeO₄. Monocristal de dimensions 0.11 × 0.05 × 0.085 mm; diffractomètre Nonius CAD-3; 20 réflexions ont servi à déterminer les paramètres de la maille; 1480 réflexions enregistrées en balayage θ–2θ (θ < 35°); 488 réflexions conservées après moyenne des réflexions équivalentes et élimination lorsque I < 3σ(I); une réflexion de référence collectée toutes les 60 mesures, pas de variation...
