The title compound, 5,5'-bis(trimethylsilylethynyl)-2,2'-bipyridine,  $C_{20}H_{24}N_2Si_2$ , is a trimethylsilyl-protected dialkyne. It is a precursor in the preparation of platinum di-yne complexes and platinum poly-yne polymers. Such organic compounds are of interest because of the extended  $\pi$ -conjugation that occurs through the hetero-aromatic linker unit in the molecular backbone. Within the molecule, the silyl-alkyne groups are essentially linear and the bipyridine unit is approximately planar with a dihedral angle of  $5.3(1)^\circ$  between the planes.

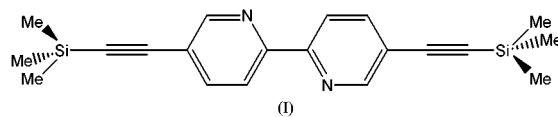

### Key indicators

Single-crystal X-ray study  
 $T = 180\text{ K}$   
Mean  $\sigma(C-C) = 0.003\text{ \AA}$   
Disorder in main residue  
 $R$  factor = 0.045  
 $wR$  factor = 0.110  
Data-to-parameter ratio = 15.3

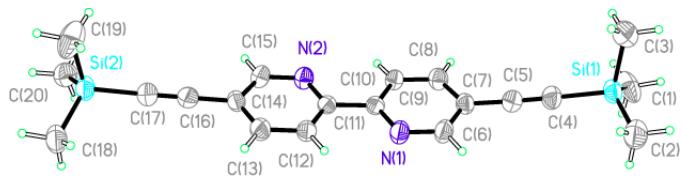

For details of how these key indicators were automatically derived from the article, see <http://journals.iucr.org/e>.

### Comment

In this paper, we report the structural characterization of the title compound, (I), which is a trimethylsilyl-protected dialkyne and a precursor of the dinuclear platinum(II) di-yne species, *trans*-[(Ph)(PEt<sub>3</sub>)<sub>2</sub>Pt—C≡C—R—C≡C—Pt(PEt<sub>3</sub>)<sub>2</sub>—(Ph)] ( $R = 2,2'$ -bipyridine-5,5'-diyl). Such organoplatinum species forms the building blocks for rigid-rod platinum polyynes with the general formula *trans*-[("Bu<sub>3</sub>P)<sub>2</sub>Pt—C≡C—R—C≡C—]̵ ( $R = \text{aromatic or heteroaromatic spacer group}$ ). Platinum polyynes are of immense current interest because of the  $\pi$ -electron conjugation that occurs along the polymer backbone, novel donor-acceptor interaction between the metal centres and the conjugated ligands, and the unique photophysical properties arising from the large spin-orbit coupling associated with the presence of the heavy metal atoms (Wittmann *et al.*, 1994; Beljonne *et al.*, 1996; Younus *et al.*, 1998; Chawdhury *et al.*, 1998, 1999; Wilson *et al.*, 2000; Wilson, Chawdhury *et al.*, 2001; Wilson, Dhoot *et al.*, 2001; Khan, Al-Mandhary, Al-Suti, Hisahm *et al.*, 2002; Khan, Al-Mandhary, Al-Feeder *et al.*, 2002; Khan, Al-Mandhary, Al-Suti, Corcoran *et al.*, 2003; Khan, Al-Mandhary, Al-Suti, Raithby, Ahrens, Male *et al.*, 2003; Khan, Al-Mandhary, Al-Suti, Raithby, Ahrens, Mahon *et al.*, 2003).

Precursors to organometallic polymers, such as the title compound, (I), are studied as models of the molecular and electronic properties and structure-property relationships that occur in metal polyynes. The central ring system of (I) is approximately planar, with a dihedral angle of  $5.3(1)^\circ$  between the planes of the two pyridine rings. The Si—C≡C and the C≡C—C(ring) units are essentially linear. There are no short intermolecular contacts within the crystal structure.

**Figure 1**

View of (I) (50% probability displacement ellipsoids). The disorder in the methyl groups has been omitted for clarity.

## Experimental

5,5'-Bis(trimethylsilylethyynyl)-2,2'-bipyridine was synthesized according to the procedure of Khan, Al-Mandhary, Al-Suti, Hisahm *et al.* (2002). To a solution of 5,5'-dibromo-2,2'-bipyridine (2.0 g, 6.37 mmol) in diisopropylamine/THF (60 ml, 1:1 *v/v*) under nitrogen was added a catalytic mixture of CuI (15 mg), Pd(OAc)<sub>2</sub> (16 mg) and PPh<sub>3</sub> (50 mg). The solution was stirred for 20 min at 323 K and then trimethylsilylethyne (2.24 ml, 15.92 mmol) was added and the mixture stirred for another 20 min. The temperature was then raised to 348 K and the reaction left under reflux with stirring for 20 h. The completion of the reaction was determined by silica thin-layer chromatography and IR spectroscopy. The solution was allowed to cool to room temperature, was filtered and the solvent mixture removed. The residue was subjected to silica column chromatography using hexane/CH<sub>2</sub>Cl<sub>2</sub> (1:2) as eluant to afford (I) as colourless needles (1.77 g, 80% yield).

### Crystal data

$M_r = 348.59$

$\theta = 2.9\text{--}25.0^\circ$

$\mu = 0.17 \text{ mm}^{-1}$

$T = 180$  (2) K

Needle, colourless

0.18 × 0.11 × 0.04 mm

### Data collection

Nonius KappaCCD diffractometer

$\omega$  scans

Absorption correction: multi-scan (Blessing, 1995)

$T_{\min} = 0.94$ ,  $T_{\max} = 0.99$

8978 measured reflections

3715 independent reflections

2301 reflections with  $I > 2\sigma(I)$

$R_{\text{int}} = 0.052$

$\theta_{\max} = 25.1^\circ$

$h = -7 \rightarrow 7$

$k = -30 \rightarrow 30$

$l = -15 \rightarrow 15$

### Refinement

Refinement on  $F^2$

$R[F^2 > 2\sigma(F^2)] = 0.045$

$wR(F^2) = 0.110$

$S = 1.00$

3715 reflections

243 parameters

H-atom parameters constrained

$w = 1/[\sigma_o^2 + (0.0476P)^2]$

where  $P = (F_o^2 + 2F_c^2)/3$

$(\Delta/\sigma)_{\max} = 0.002$

$\Delta\rho_{\max} = 0.18 \text{ e } \text{\AA}^{-3}$

$\Delta\rho_{\min} = -0.20 \text{ e } \text{\AA}^{-3}$

The two trimethylsilyl groups are partially disordered, and one CH<sub>3</sub> group on each terminal group was refined over two positions with occupancies of 0.3 (1) and 0.7 (1) for C1 and C1', respectively, and 0.56 (2) and 0.44 (2) for C18 and C18', respectively; the associated H atoms were assigned the same occupancies. All aromatic and

methyl H atoms were constrained as riding atoms, fixed to the parent atoms with distances of 0.93 and 0.96 Å, respectively.  $U_{\text{iso}}$  values were set equal to 1.2  $U_{\text{eq}}$  (1.5 for methyl H) of the parent atom.

Data collection: COLLECT (Nonius, 1997); cell refinement: HKL SCALEPACK (Otwinowski & Minor, 1997); data reduction: HKL SCALEPACK and DENZO (Otwinowski & Minor); program(s) used to solve structure: SHELXS97 (Sheldrick, 1997); program(s) used to refine structure: SHELXL97 (Sheldrick, 1997); molecular graphics: ORTEP-3 for Windows (Farrugia, 1997); software used to prepare material for publication: WinGX (Farrugia, 1999).

We thank Sultan Qaboos University, Oman, the Royal Society, England, the Cambridge Crystallographic Data Centre, England, the EPSRC, England, and the DAAD, Germany, for funding.

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
