Key indicators

Single-crystal X-ray study

T = 200 K

Mean σ (C–C) = 0.006 Å

R factor = 0.064

wR factor = 0.190

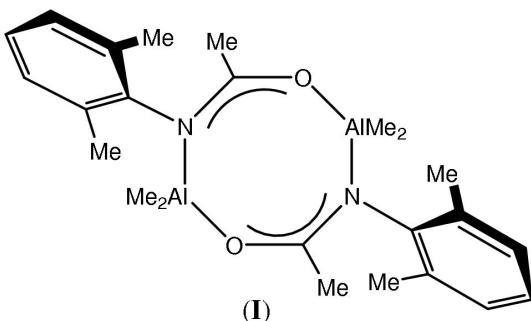

Data-to-parameter ratio = 16.5

For details of how these key indicators were automatically derived from the article, see <http://journals.iucr.org/e>.

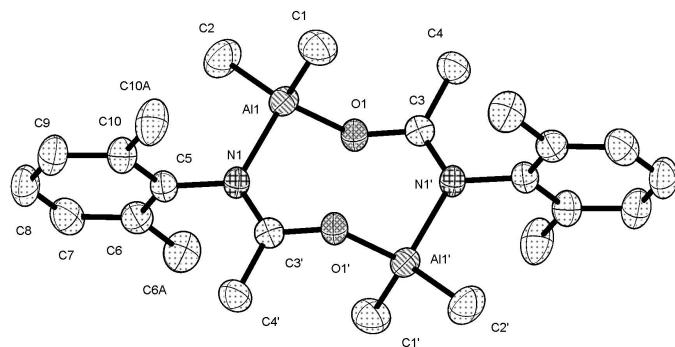

The structure of the title compound, $[Al_2(CH_3)_4(C_{10}H_{12}NO)_2]$ or $[Me_2Al\{\mu-(2,6-Me_2C_6H_3)NCMeO\}]_2$, consists of a four-coordinate dimeric centrosymmetric eight-membered ring Al-containing species.

Received 16 May 2005
Accepted 19 May 2005
Online 28 May 2005**Comment**

The synthesis and structural characterization of alkyl-aluminium complexes containing *N,O*-amide ligands, $[R^I NCR(=O)]^-$ (R = alkyl or aryl), has recently received attention due, in part, to the rich variety of bonding modes that are accessible. For example, the ligand can bridge, chelate or act as a monodentate ligand to a single metal centre, the precise bonding mode being dependent on the acidity and the steric bulk of the amide precursor employed (Huang *et al.*, 2002). Furthermore, the reactions of amides with R_3Al have allowed access to aluminium diketimates, some of which are not obtainable by more conventional synthetic routes (Huang *et al.*, 2001).

We report here the synthesis and the crystal structure of $[Me_2Al\{\mu-(2,6-Me_2C_6H_3)NCMeO\}]_2$, (I). The 1H NMR spectrum gives methyl resonances in a ratio of 12:6:12, corresponding to the aromatic (δ 2.40), acetamide (δ 1.70) and aluminium methyls (δ -0.15), respectively. The X-ray analysis of (I) reveals a dimeric structure based on a centrosymmetric eight-membered ring. The bridging amidate ligand coordinates to the two Al atoms through both the N and the O atoms. The geometry at each Al atom can be best described as distorted tetrahedral, with two methyl C atoms, an N atom and an O atom occupying the coordination sites. The C3–O1 [1.296 (4) Å] and C3–N1A [1.298 (4) Å] bond lengths suggest some delocalization within the OCN moiety. The Al1–O1 [1.800 (3) Å], Al1–N1 [1.961 (3) Å], Al1–C1 [1.968 (5) Å] and Al1–C2 [1.961 (4) Å] bond distances in (I) are comparable with the corresponding distances observed in the related structures $[Me_2Al\{\mu-(C_6H_5)NCPPhO\}]_2$ (Kai *et al.*, 1971) and

**Figure 1**

Molecular structure of (I), showing the atom-numbering scheme and 50% probability displacement ellipsoids. The molecule is located on a centre of symmetry [primed atoms are generated by $(1 - x, 2 - y, 2 - z)$]. H atoms have been omitted for clarity.

$[\text{Me}_2\text{Al}\{\mu\text{-}(2,6\text{-Pr}_2^i\text{C}_6\text{H}_3)\text{NCPhO}\}]_2$ (Huang *et al.*, 2002). The benzene rings are arranged orthogonal to the puckered eight-membered ring. There are no intermolecular packing interactions of note.

Experimental

Under an atmosphere of nitrogen, trimethylaluminium (3.07 ml, 6.13 mmol, 2*M* solution in toluene) was added to a solution of *N*-(2,6-dimethylphenyl)acetamide (0.50 g, 3.06 mmol) in toluene (30 ml), and the reaction mixture was heated to reflux for 12 h. On cooling to room temperature, the volatiles were removed under reduced pressure and the residue dried overnight. Slow cooling of a hot acetonitrile (40 ml) solution containing the complex gave pale-yellow crystals of the title compound suitable for single-crystal X-ray diffraction analysis (yield 0.50 g, 75%). Analysis found: C 65.89, H 8.31, N 6.57%; calculated for $\text{C}_{24}\text{H}_{36}\text{Al}_2\text{N}_2\text{O}_2$: C 65.75, H 8.22, N 6.39%. ^1H NMR (C_6D_6): δ 7.20–7.05 (*m*, 6H, Ar–H), 2.40 (*s*, 12H, Ar–Me), 1.70 [*s*, 6H, MeC(O)] and –0.15 (*s*, 12H, Al–CH₃).

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
