2-Iodobenzenesulfonyl chloride

Received 13 January 2006
Accepted 20 January 2006

In the molecule of 2-iodobenzenesulfonyl chloride, $\text{C}_6\text{H}_4\text{IO}_2\text{S}^+\cdot\text{Cl}^-$, the *ortho* substitution by large atoms causes angular distortions at the ring C atoms rather than significant displacement of the substituents out of the ring plane.

Comment

The title compound, (I) (Fig. 1), was prepared as an intermediate in the synthesis of dibenzo[*ce*][1,2]dithiine and its related oxides (Aucott *et al.*, 2004; Aucott *et al.*, 2004*a,b*; Aucott, Kilian *et al.*, 2005; Aucott, Milton *et al.*, 2005) as part of a study of conformationally restricted molecules.

Compound (I) crystallizes in the monoclinic space group $P2_1/n$. The aromatic ring is essentially planar, with atom S1 0.14 (1) Å and I1 –0.08 (1) Å from this plane. The SO_2Cl group is oriented with O2 close to the aromatic plane [0.16 (1) Å] and O1 and Cl1 lying 1.13 (1) and –1.165 (1) Å above and below this plane, respectively. The *ortho* substitution of two heavy atoms results in enlargement of angles at carbon of the aromatic ring; C2–C1–I1 = 125.00 (18)° and S1–C2–C1 = 123.23 (19)°.

Experimental

2-Iodobenzenesulfonyl chloride was prepared as previously described (Chau & Kice, 1977) and was crystallized from chloroform/hexane (1:1 *v/v*) to give well formed colourless blocks.

Crystal data

$\text{C}_6\text{H}_4\text{IO}_2\text{S}^+\cdot\text{Cl}^-$	$D_x = 2.360\text{ Mg m}^{-3}$
$M_r = 302.50$	Mo $K\alpha$ radiation
Monoclinic, $P2_1/n$	Cell parameters from 3111
$a = 8.338 (3)\text{ \AA}$	reflections
$b = 12.741 (3)\text{ \AA}$	$\theta = 2.5\text{--}25.4^\circ$
$c = 8.517 (2)\text{ \AA}$	$\mu = 4.26\text{ mm}^{-1}$
$\beta = 109.797 (7)^\circ$	$T = 93 (2)\text{ K}$
$V = 851.3 (4)\text{ \AA}^3$	Block, colourless
$Z = 4$	$0.10 \times 0.10 \times 0.08\text{ mm}$

Data collection

Rigaku MM007/Mercury CCD diffractometer
 φ and ω scans
 Absorption correction: multi-scan (*SADABS*; Bruker, 2001)
 $T_{\min} = 0.600$, $T_{\max} = 0.710$
 4840 measured reflections

1496 independent reflections
 1457 reflections with $I > 2\sigma(I)$
 $R_{\text{int}} = 0.013$
 $\theta_{\max} = 25.4^\circ$
 $h = -10 \rightarrow 9$
 $k = -15 \rightarrow 12$
 $l = -8 \rightarrow 10$

Refinement

Refinement on F^2
 $R[F^2 > 2\sigma(F^2)] = 0.016$
 $wR(F^2) = 0.033$
 $S = 1.13$
 1496 reflections
 101 parameters
 H-atom parameters constrained

$$w = 1/[\sigma^2(F_o^2) + (0.0044P)^2 + 1.4521P]$$

where $P = (F_o^2 + 2F_c^2)/3$

$$(\Delta/\sigma)_{\max} = 0.001$$

$$\Delta\rho_{\max} = 0.47 \text{ e } \text{\AA}^{-3}$$

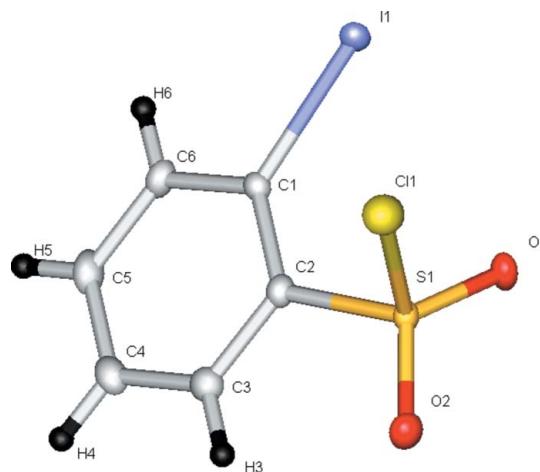

$$\Delta\rho_{\min} = -0.46 \text{ e } \text{\AA}^{-3}$$

All H atoms were included in calculated positions ($C-H = 0.95 \text{ \AA}$) and were refined as riding atoms, with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$.

Data collection: *CrystalClear* (Rigaku/MSC, 2004); cell refinement: *CrystalClear*; data reduction: *CrystalClear*; program(s) used to solve structure: *SHELXS97* (Sheldrick, 1997a); program(s) used to refine structure: *SHELXL97* (Sheldrick, 1997a); molecular graphics: *SHELXTL* (Sheldrick, 1997b); software used to prepare material for publication: *SHELXTL*.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
