Key indicators

Single-crystal X-ray study
 $T = 160\text{ K}$
 Mean $\sigma(\text{C}-\text{C}) = 0.011\text{ \AA}$
 R factor = 0.035
 wR factor = 0.079
 Data-to-parameter ratio = 6.8

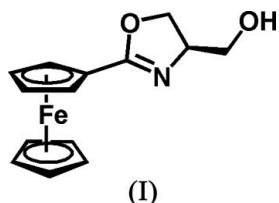

For details of how these key indicators were automatically derived from the article, see <http://journals.iucr.org/e>.

The title compound, $[\text{Fe}(\text{C}_5\text{H}_5)(\text{C}_9\text{H}_{10}\text{NO}_2)]$, was prepared from ferrocenecarboxylic acid and serine. In the crystal structure, molecules are arranged in chains with an intermolecular hydrogen bond between hydroxy groups and N atoms.

Received 3 February 2006
 Accepted 27 February 2006

Comment

A series of serine-derived oxazoles has been shown to be effective in asymmetric alkylation reactions, and hence their crystal structures are of interest (Jones & Richards, 2004). As representatives of the general amino alcohol class of ligands for these reactions, we have an interest in understanding their non-linear catalytic characteristics. A single-crystal X-ray structure has been reported for a related compound, *viz.* (4*S*)-4-(1-hydroxy-1-methylethyl)-2-ferrocenyl-4,5-dihydro-1,3-oxazole monohydrate (Chesney *et al.*, 1998).

The structure of the title compound, (I) (Fig. 1), reveals that the two cyclopentadienyl rings of ferrocene deviate by only four degrees from a fully eclipsed conformation. The torsion angle $\text{C}1-\text{C}1\text{c}-\text{C}2\text{c}-\text{C}11$ (where $\text{C}1\text{c}$ and $\text{C}2\text{c}$ are the cyclopentadiene ring centroids) is $-3.5(6)^\circ$. The oxazoline ring is almost coplanar with the cyclopentadienyl ring to which it is attached [interplanar angle = $9.2(5)^\circ$ and $\text{C}2-\text{C}1-\text{C}6-\text{O}1 = -6.3(10)^\circ$], the O rather than the N atom being slightly closer to iron. The oxazoline hydroxymethyl substituent is oriented away from the iron-cyclopentadienyl group of ferrocene. Significantly, the opposite rotamer, with respect to rotation about the ferrocene-oxazoline C–C σ -bond, was observed in the structure reported by Chesney *et al.* (1998). This contains a larger 1-hydroxy-1-methylethoxyoxazoline substituent, and in both cases the hydroxy group is oriented over the oxazoline ring; in the present structure, $\text{N}1-\text{C}8-\text{C}9-\text{O}2 = -73.7(7)^\circ$.

Experimental

LiAlH_4 (68 mg, 1.797 mmol, 1.1 equivalent) was added to a solution of (S)-4-carbomethoxy-2-ferrocenyl-1,3-oxazoline (513 mg, 1.634 mmol) in diethyl ether (15 ml) cooled to 273 K. After stirring for 15 min, ethyl acetate (25 ml) was added followed by water (38 ml), and the organic layer was then separated, dried (MgSO_4),

filtered and concentrated *in vacuo* to give the crude alcohol as an orange solid. The crude solid was recrystallized from dichloromethane and hexane (*ca* 1:1) to give the pure oxazoline [434 mg, 93%; m.p. 390–392 K (literature 390–392 K)]. ^1H NMR (CDCl_3): δ 3.59 (1H, *dd*, $J = 11.4, 3.7$ Hz, OCHH) and 3.86 (1H, *dd*, $J = 11.4, 3.2$ Hz OCHH), 4.16 (5H, *s*, Cp), 4.18–4.40 (5H, *m*, OCH₂ + CHN + Cp $\times 2$), 4.72 (2H, *m*, Cp).

Special details

Experimental. Number of psi-scan sets used was 3 Theta correction was applied. Averaged transmission function was used. No Fourier smoothing was applied.

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
