Received 22 November 2007; accepted 23 November 2007

Key indicators: single-crystal X-ray study; $T = 299$ K; mean $\sigma(\text{C}-\text{C}) = 0.005$ Å; R factor = 0.067; wR factor = 0.190; data-to-parameter ratio = 14.8.

The conformation of the N–H bond in the structure of the title compound, $\text{C}_{10}\text{H}_{12}\text{ClNO}$, is *syn* to the *ortho* methyl group, similar to that observed with respect to the *meta* methyl group in 2-chloro-N-(3-methylphenyl)acetamide and the *ortho*-chloro group in 2-chloro-N-(2-chlorophenyl)acetamide. The geometric parameters are similar to those of other acetanilides. The molecules are linked into chains through intermolecular N–H···O hydrogen bonds.

2-Chloro-N-(2,4-dimethylphenyl)acetamide

B. Thimme Gowda, Sabine Foro and Hartmut Fuess

S1. Comment

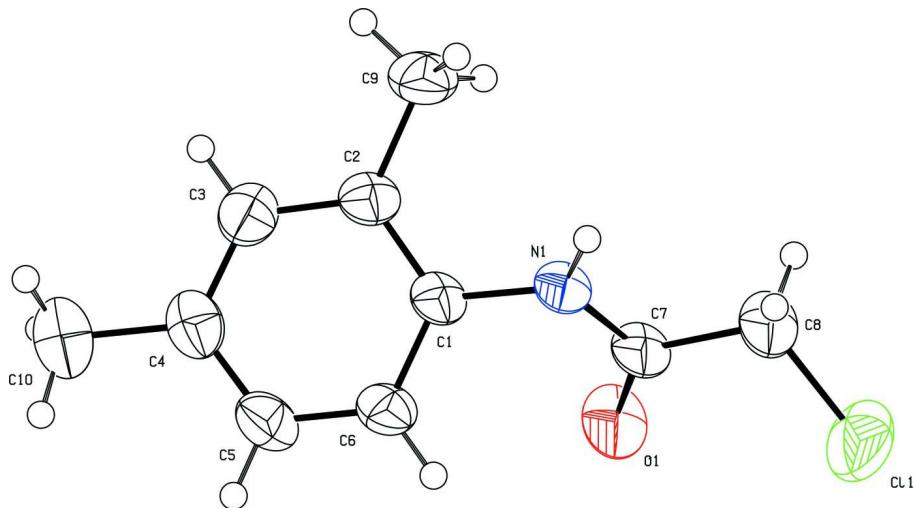

In the present work, the structure of 2-chloro-*N*-(2,4-dimethylphenyl)- acetamide (24DMPCA) has been determined as part of a study of the effect of ring and side chain substitutions on the solid state geometry of aromatic amides (Gowda *et al.*, 2007*a, b, c, d, e*). The conformation of the N—H bond in the structure of 24DMPCA is *syn* to the *ortho* methyl group (Fig. 1), similar to that observed with respect to the *meta* methyl group in the 2-chloro- *N*-(3-methylphenyl)acetamide (3MPCA)(Gowda *et al.*, 2007*e*). and *ortho* chloro group in the 2-chloro-*N*-(2-chlorophenyl)- acetamide(2CPCA)(Gowda *et al.*, 2007*d*). The geometric parameters in 24DMPCA are similar to those in 3MPCA (Gowda *et al.*, 2007*e*), 2CPCA (Gowda *et al.*, 2007*d*), 2-chloro-*N*-(4-methylphenyl)- acetamide (Gowda *et al.*, 2007*b*), 2-chloro-*N*- (4-chlorophenyl)- acetamide (Gowda *et al.*, 2007*c*) and other acetanilides (Gowda *et al.* , 2007*a*). The molecules in the structure are linked into chains through intermolecular N—H···O hydrogen bonding (Table 1 and Fig.2).

S2. Experimental

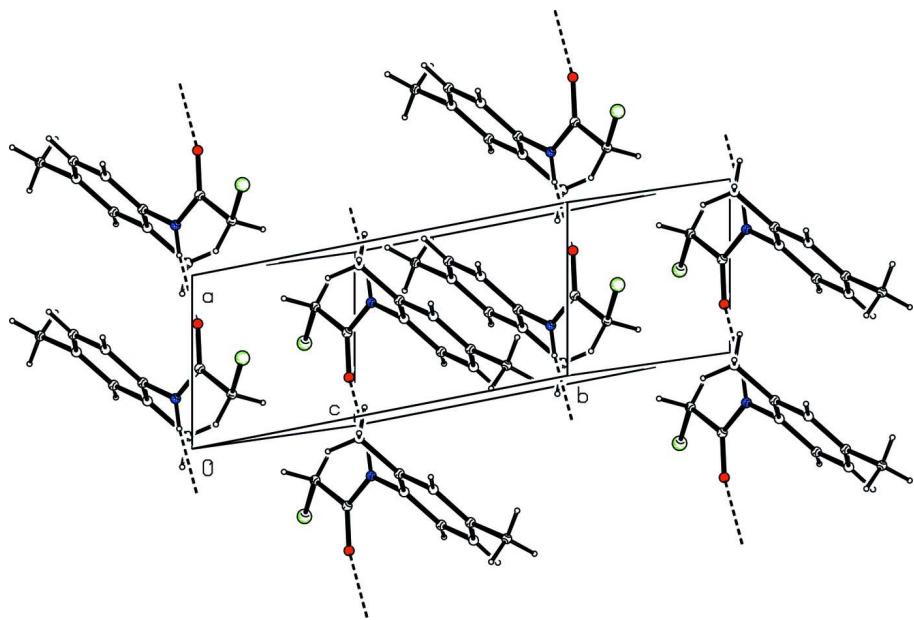

The title compound was prepared according to the literature method (Shilpa and Gowda, 2007). The purity of the compound was checked by determining its melting point. It was characterized by recording its infrared and NMR spectra (Shilpa and Gowda, 2007). Single crystals of the title compound were obtained from an ethanolic solution and used for X-ray diffraction studies at room temperature.

S3. Refinement

The CH atoms were positioned with idealized geometry using a riding model with C—H = 0.93–0.97 Å. The NH atom was located in difference map and its coordinates were refined. $U_{\text{iso}}(\text{H})$ values were set equal to 1.2 $U_{\text{eq}}(\text{C},\text{N})$ or 1.2 $U_{\text{eq}}(\text{C}_{\text{methyl}})$.

**Figure 1**

Molecular structure of the title compound showing the atom labelling scheme. Displacement ellipsoids are drawn at the 50% probability level. H atoms are represented as small spheres of arbitrary radii.

**Figure 2**

Molecular packing of the title compound with hydrogen bonding shown as dashed lines.

 $\mu = 3.00 \text{ mm}^{-1}$

$T = 299 \text{ K}$
 Needle, colourless
 $0.60 \times 0.06 \times 0.04 \text{ mm}$

Data collection

Enraf–Nonius CAD-4
 diffractometer
 Radiation source: fine-focus sealed tube
 Graphite monochromator
 $\omega/2\theta$ scans
 Absorption correction: ψ scan
 North *et al.* (1968)
 $T_{\min} = 0.803$, $T_{\max} = 0.895$
 2059 measured reflections

1817 independent reflections
 1394 reflections with $I > 2\sigma(I)$
 $R_{\text{int}} = 0.015$
 $\theta_{\max} = 66.9^\circ$, $\theta_{\min} = 4.2^\circ$
 $h = 0 \rightarrow 5$
 $k = -12 \rightarrow 12$
 $l = -13 \rightarrow 13$
 3 standard reflections every 120 min
 intensity decay: 1.0%

Refinement

Refinement on F^2
 Least-squares matrix: full
 $R[F^2 > 2\sigma(F^2)] = 0.067$
 $wR(F^2) = 0.190$
 $S = 1.09$
 1817 reflections
 123 parameters
 0 restraints
 Primary atom site location: structure-invariant
 direct methods

Secondary atom site location: difference Fourier
 map
 Hydrogen site location: inferred from
 neighbouring sites
 H atoms treated by a mixture of independent
 and constrained refinement
 $w = 1/[\sigma^2(F_o^2) + (0.1035P)^2 + 0.2646P]$
 where $P = (F_o^2 + 2F_c^2)/3$
 $(\Delta/\sigma)_{\max} = 0.044$
 $\Delta\rho_{\max} = 0.45 \text{ e \AA}^{-3}$
 $\Delta\rho_{\min} = -0.47 \text{ e \AA}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
