Correspondence e-mail: hxiang@shu.edu.cn

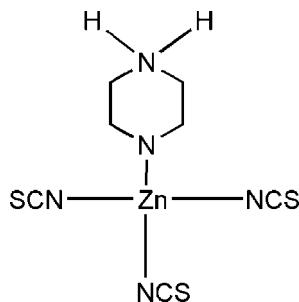

Received 16 November 2007; accepted 2 December 2007

Key indicators: single-crystal X-ray study;  $T = 293\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.007\text{ \AA}$ ;  $R$  factor = 0.064;  $wR$  factor = 0.154; data-to-parameter ratio = 15.1.

Hydrothermal reaction of NaSCN, piperazine, Zn<sup>II</sup> and 2,6-naphthalenedicarboxylic acid in aqueous solutions gave rise to the title complex, [Zn(NCS)<sub>3</sub>(C<sub>4</sub>H<sub>11</sub>N<sub>2</sub>)]. The Zn<sup>II</sup> atom is four-coordinate with distorted tetrahedral geometry and lies in a mirror plane. N—H···S hydrogen bonds assemble the molecules to form a three-dimensional framework.

## (Piperazin-1-ium- $\kappa N^4$ )tris(thiocyanato- $\kappa N$ )zinc(II)

Xiang He, Hong-Jiang Liu and Ming-Xing Li

### S1. Comment

$d^{10}$  metal complexes have been found to exhibit intriguing structural and photoluminescent properties (Liu *et al.*, 2007; Dai *et al.*, 2002; Ouyang *et al.*, 2003; Gu *et al.*, 2007; Tao *et al.*, 2003). When trying to prepare the zinc complex containing 2,6-naphthalenedicarboxylic acid, piperazine and thiocyanate ligands by hydrothermal reaction, we did not obtain the expected compound but instead of the tri-isothiocyanato-(piperazinium-N')-zinc(II) compound (I). The new complex has been characterized by elemental analysis and single-crystal diffraction analysis.

The Zn atom adopts a distorted tetrahedral coordination geometry and is coordinated by three N atoms from the thiocyanate anions and one piperazine N atom (Fig. 1). The Zn atom, one thiocyanate ligands and N atoms of piperazine ligands are located on a mirror plane. The Zn—N3 (piperazine) bond length is 2.054 (6) Å and the Zn-NCS bond lengths are almost equal at 1.935 (5) Å for N1 and 1.933 (8) Å for N2, respectively. The N—Zn—N angles are in the range 107.7 (3) ° ~ 112.3 (3) °. All bond distances and angles are as observed for other zinc(II) complexes with piperazine and thiocyanate ligands (Bie *et al.*, 2005). There are intermolecular N—H···S hydrogen bonds in the compound, which assemble the molecules to form a a three dimensionnal framework.(Table 1 and Fig. 2)

### S2. Experimental

A mixture of  $ZnCl_2 \cdot 6H_2O$  (0.49 g, 2 mmol), 2,6-naphthalenedicarboxylic acid (1 mmol, 0.26 g), piperazine (2 mmol, 0.17),  $NH_4SCN$  (10 mmol, 0.15) and  $H_2O$  (10 ml) was stirred for 0.5 h at room temperature. The reaction was carried out in a Teflon-lined steel autoclave, which was heated at 160°C for 2 d followed by slow cooling to room temperature. The resulting colorless prism-shaped crystals suitable for X-ray analysis were filtered off and washed with water. Analysis, calculated for  $C_7H_{11}N_5S_3Zn$ : C 25.96, H 3.13, N 21.79%; found: C 25.73, H 3.39, N 21.43%.

### S3. Refinement

H atoms were placed in idealized positions, with C—H distances of 0.97 Å, N—H distances of 0.90 Å, and allowed to ride on their respective parent C atoms with the constraint  $U_{iso}(H) = 1.2U_{eq}(C)$ .

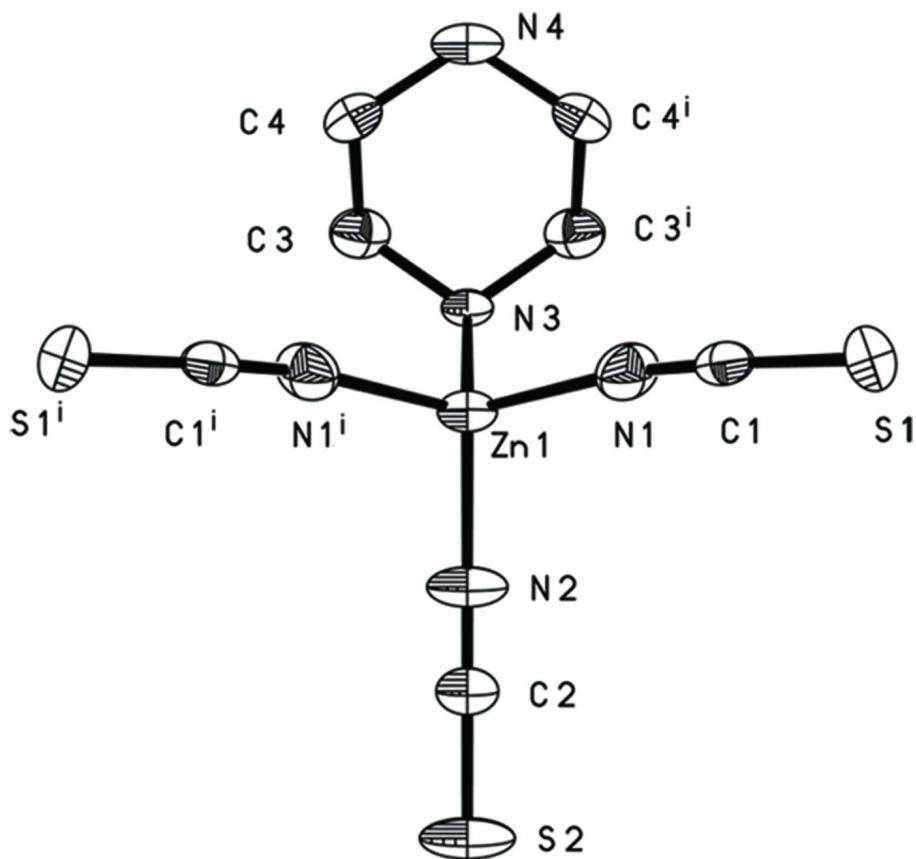

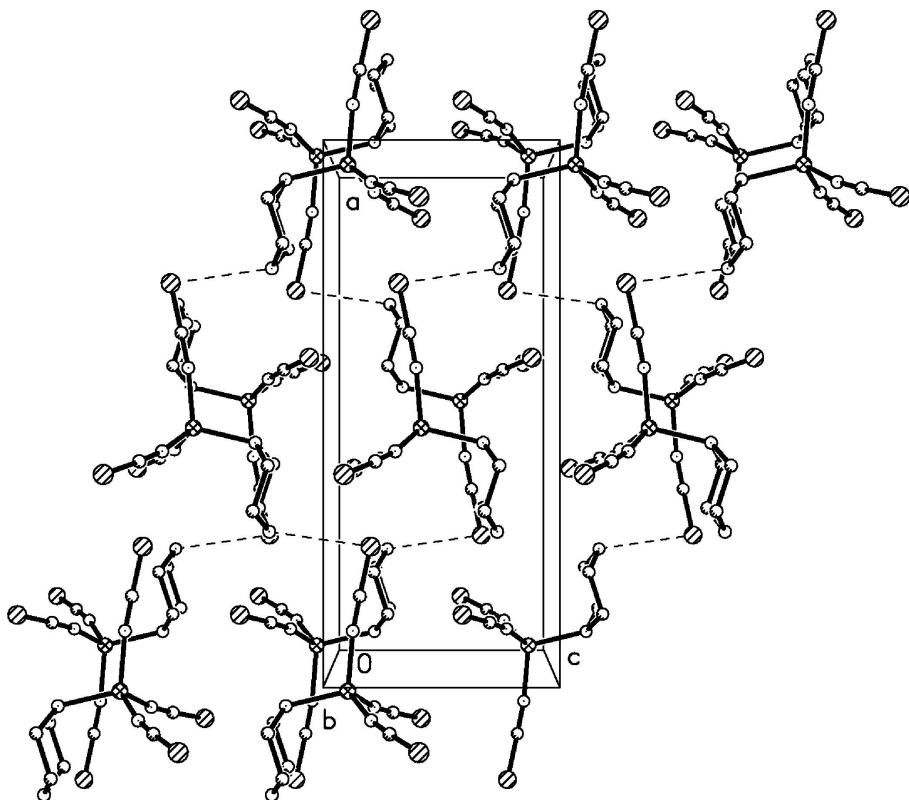

Figure 1

View of (I) with the atom-labelling scheme. Displacement ellipsoids are drawn at the 30% probability level. [symmetry codes: (i)  $x, -y + 1/2, z$ ].

**Figure 2**

Crystal packing diagram of compound (I), Hydrogen bonding is indicated by dashed lines.

$$\Delta\rho_{\min} = -0.48 \text{ e \AA}^{-3}$$

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
