Received 21 November 2007; accepted 27 November 2007

 Key indicators: single-crystal X-ray study;  $T = 173$  K; mean  $\sigma(\text{C}-\text{C}) = 0.009$  Å;  $R$  factor = 0.043;  $wR$  factor = 0.083; data-to-parameter ratio = 17.8.

In the title compound,  $[\text{U}(\text{C}_{15}\text{H}_{11}\text{O}_2)_2\text{O}_2(\text{C}_2\text{H}_6\text{O})]$ , the  $\text{U}^{\text{VI}}$  atom has a pentagonal-bipyramidal coordination geometry. The two so-called '-yl' O atoms occupy the axial positions whereas four O atoms from the two chelating dibenzoyl-methanate ligands and the O atom from the ethanol molecule are situated in the equatorial plane. Intermolecular hydrogen bonds between one of the '-yl' O atoms and the ethanol OH group assemble molecules into a centrosymmetric dimer.

## Bis(2-benzoyl-1-phenylethenolato- $\kappa^2O,O'$ )(ethanol- $\kappa O$ )dioxidouranium(VI)

K. Takao and Y. Ikeda

### Comment

Structural chemistry of uranyl(VI) complexes with dibenzoylmethanate (dbm) and unidentate ligands ( $L$ ) has been extensively explored (Kannan *et al.*, 1997*a,b*, 1995, 2000; Rajagopal *et al.*, 2002; Fun, Kannan, S., Chantrapromma *et al.* 2002; Fun, Kannan, S., Usman *et al.* 2002 Alagar *et al.*, 2003, 2004). Generally, two dbm and one  $L$  are placed in an equatorial plane of the uranyl(VI) ion ( $UO_2^{2+}$ ). This results in a  $UO_2(dbm)_2L$  complex with a pentagonal-bipyramidal geometry around the uranium atom. In our previous study, we also used  $UO_2(dbm)_2DMSO$  complex (DMSO = dimethyl sulfoxide) as a precursor of a corresponding uranyl(V) complex,  $[U^V O_2(dbm)_2DMSO]^-$  (Mizuoka & Ikeda, 2004). In our recent experiment, we obtained crystals of the title compound,  $UO_2(dbm)_2EtOH$  (**I**), suitable for single-crystal X-ray analysis. In this paper, we report results of the structure determination of **I** to accumulate more structural data in a series of  $UO_2(dbm)_2L$  complexes.

The molecular structure of **I** is shown in Fig. 1. The uranium atom in **I** is surrounded by seven O atoms; two O are at the axial positions, and the remaining five O from dbm and EtOH in the equatorial plane. As a consequence, the coordination geometry around U in **I** is pentagonal bipyramidal. The deviations of the O atoms in dbm and EtOH from the equatorial plane are within 0.1 Å.

Bond lengths in **I** are listed in Table 1, and are similar to the structural parameters of other  $UO_2(dbm)_2L$  complexes reported previously. As an exception, the bond length between U and O of EtOH [ $U1-O7 = 2.464(4)$  Å] seems to be slightly longer than the corresponding bond lengths in the  $UO_2(dbm)_2L$  complexes ( $L$  = di-substituted sulfoxides, dibenzoylacetone, and triphenylphosphine oxide), while shorter than those with  $H_2O$ , malonanilide, and camphor. It is likely that the bond length between U and O of  $L$  ( $U-O_L$ ) depends on donicity of  $L$  (Linert *et al.* 2001). In this discussion, the steric effect of  $L$  should also be taken into account. However, it is not the case of **I**, because there seems to be no significant steric hindrance due to EtOH in its molecular structure shown in Fig. 1.

Intermolecular hydrogen bond between OH group of ethanol and the -yl oxygen,  $O7-H6\cdots O2^i$  [symmetry operation: (i)  $1-x, 1-y, 1-z$ ], was observed between the neighboring complex molecules (Table 2). This results in a dimeric aggregate of **I** as shown in Fig. 2.

### Experimental

Solution of uranyl nitrate hexahydrate (1.20 g) in 2 ml of ethanol was added to a hot solution (10 ml) of dibenzoylmethane (Hdbm, 0.523 g) in 10 ml of ethanol with vigorous stirring. After addition of 1 N NaOH (3 ml), the solution was concentrated by heating, and then cooled to room temperature. Deposited crystals of the title compound were filtered off, washed with ethanol, and dried under the ambient atmosphere.

## Refinement

The structure was solved by direct methods, *SIR97* (Altomare *et al.*, 1999) and expanded using Fourier techniques (Beurskens *et al.*, 1999). The H atom from the OH group was located from a difference map and the remaining H atoms were placed at calculated positions. All H atoms were refined as riding on their parent atoms with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C}, \text{O})$ .

## Figures

Fig. 1. : Molecular structure of  $\text{UO}_2(\text{dbm})_2\text{EtOH}$  (**I**) with displacement ellipsoids shown at the 50% probability level. Hydrogen atoms are omitted for clarity.

Fig. 2. : Structure of the dimeric aggregate of **I** [molecules are related by the symmetry operation (i)  $1 - x, 1 - y, 1 - z$ ]. Dashed lines indicate intermolecular  $-\text{OH}\cdots\text{O}_{y1}$  hydrogen bonds between neighboring molecules. Hydrogen atoms except for the OH group are omitted for clarity.

### Refinement

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.043$	H-atom parameters constrained
$wR(F^2) = 0.083$	$w = 1/[\sigma^2(F_o^2) + (0.0288P)^2 + 2.9796P]$
$S = 1.01$	where $P = (F_o^2 + 2F_c^2)/3$
6442 reflections	$(\Delta/\sigma)_{\max} = 0.001$
362 parameters	$\Delta\rho_{\max} = 1.05 \text{ e } \text{\AA}^{-3}$
Primary atom site location: structure-invariant direct methods	$\Delta\rho_{\min} = -0.69 \text{ e } \text{\AA}^{-3}$
	Extinction correction: none

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\sigma(F^2)$  is used only for calculating  $R$ -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
