Received 6 November 2007; accepted 28 November 2007

Key indicators: single-crystal X-ray study; $T = 273\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$; R factor = 0.024; wR factor = 0.054; data-to-parameter ratio = 20.0.

The asymmetric unit of the title compound, $(\text{C}_5\text{H}_{14}\text{N}_2)_2[\text{SbCl}_5]\cdot\text{H}_2\text{O}$, consists of an *N*-methylpiperazinium cation, a pentachloridoantimonate anion with the Sb^{III} ion in a slightly distorted square-pyramidal coordination environment, and one solvent water molecule. The crystal structure is stabilized by intermolecular N—H···Cl, O—H···Cl and N—H···O hydrogen bonds.

N-Methylpiperazinium pentachloridoantimonate(III) monohydrate

Chao Shen-Tu, Hai Yan Li, Xin Ju Ma, Wei Huang and Zhi Min Jin

S1. Comment

Halogenoantimonates constitute a group of salts in which a number of compounds have been reported (e.g. Feng *et al.*, 2007; Bujak & Zaleski, 1999; Knodler *et al.*, 1988; Baker & Williams, 1978 and see: Clemente & Marzotto (2003); Marsh *et al.* (1995) for corrected space groups of some of these types of compounds). In our laboratory, a compound containing pentachloridoantimonate has been synthesized, its crystal structure is reported herein.

As shown in Fig. 1, an ion pair consisting of *N*-methylpiperazinium and $(\text{SbCl}_5)^{2+}$, and one water molecule comprise the formula unit. In the selected asymmetric unit The SbCl_5 anion is linked to *N*-methylpiperazinium and the water molecule by N—H···Cl and O—H···Cl hydrogen bonds.

The Sb atom is coordinated by five Cl atoms, with Sb—Cl distances ranging from 2.4110 (10) to 2.9112 (11) Å. The Sb—Cl distances are slightly different to the values of 2.499 (4)–2.768 (4) Å reported by Bujak & Zaleski (1999). In the title compound the difference between the longest bond (Sb1—Cl5) and shortest bond (Sb1—Cl2) is *ca* 0.50 Å. The slight deformation of the square-pyramidal coordination environment may be attributed to the presence of relatively strong N—H···Cl hydrogen bonds. The atoms Cl1/Cl3/Cl4/Cl5 form the basal plane, while atom Cl2 is the apical atom. The structure of the anion is similar to that of the $(\text{TiCl}_5)^{2-}$ anion (Linden *et al.*, 1999).

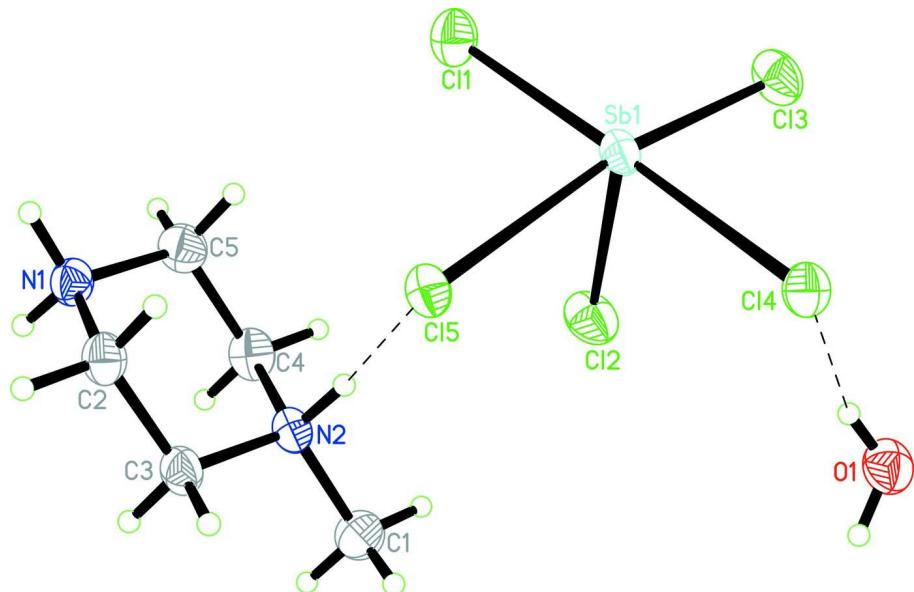

The six-membered piperazine ring is in chair conformation. The crystal structure is stabilized by N—H···Cl, O—H···Cl and N—H···O hydrogen bonds, and by weak C—H···Cl and C—H···O hydrogen bonds (Fig. 2).

S2. Experimental

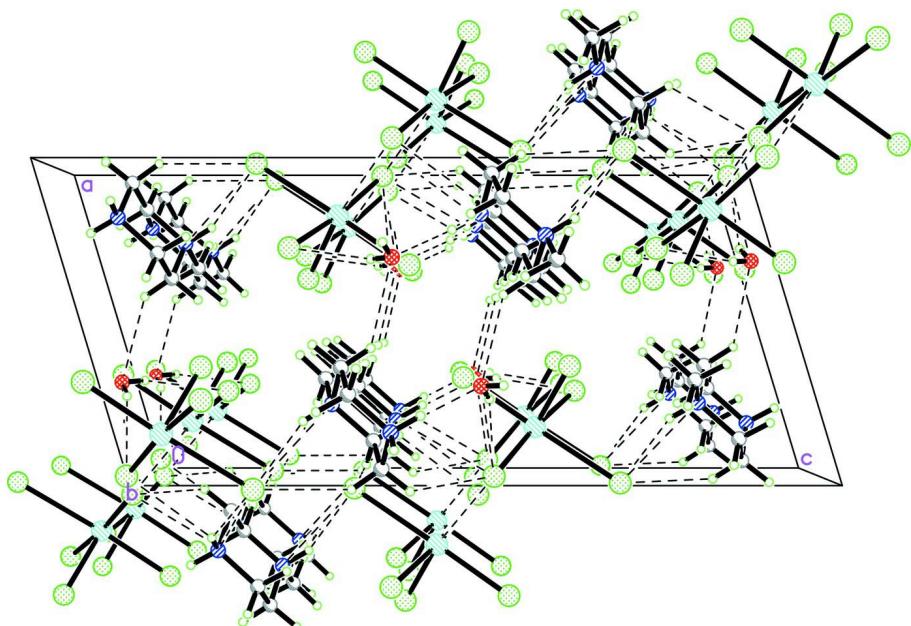

SbCl_3 , *N*-methylpiperazine and 30% aqueous HCl in a molar ratio of 1:1:1 were mixed and dissolved in sufficient ethanol by heating to 373 K forming a clear solution. The reaction mixture was cooled slowly to room temperature, crystals of the title compound were formed, collected and washed with dilute aqueous HCl.

S3. Refinement

H atoms were included in calculated positions with O—H = 0.82, N—H = 0.90–0.91 and C—H = 0.96–0.97 Å and included in the riding-model approximation with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C}, \text{N}, \text{O})$ or $1.5U_{\text{eq}}(\text{C})$ for methyl H atoms.

**Figure 1**

 $w = 1/[\sigma^2(F_o^2) + (0.0213P)^2 + 0.8984P]$
where $P = (F_o^2 + 2F_c^2)/3$
 $(\Delta/\sigma)_{\max} = 0.002$
 $\Delta\rho_{\max} = 0.35$ e Å⁻³
 $\Delta\rho_{\min} = -0.48$ e Å⁻³
Extinction correction: SHELXL,
 $F_c^* = kFc[1 + 0.001xFc^2\lambda^3/\sin(2\theta)]^{-1/4}$
Extinction coefficient: 0.0050 (3)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
