Received 16 November 2007; accepted 18 December 2007

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$; R factor = 0.056; wR factor = 0.132; data-to-parameter ratio = 10.7.

The title molecule, $\text{C}_{20}\text{H}_{20}\text{N}_2$, is chiral; the absolute configuration follows from the known chirality of the input reagents. In addition to van der Waals forces, $\text{C}-\text{H}\cdots\pi$ ring interactions are also present. The angle between the planes of the phenyl rings is $65.6(1)^\circ$. The heterocyclic ring of the quinoxaline system has a twist-boat configuration, while the cyclohexane ring has a chair configuration.

(4a*R*,8a*R*)-2,3-Diphenyl-4a,5,6,7,8,8a-hexahydroquinoxaline

Guo-Xi Wang and Heng-Yun Ye

S1. Comment

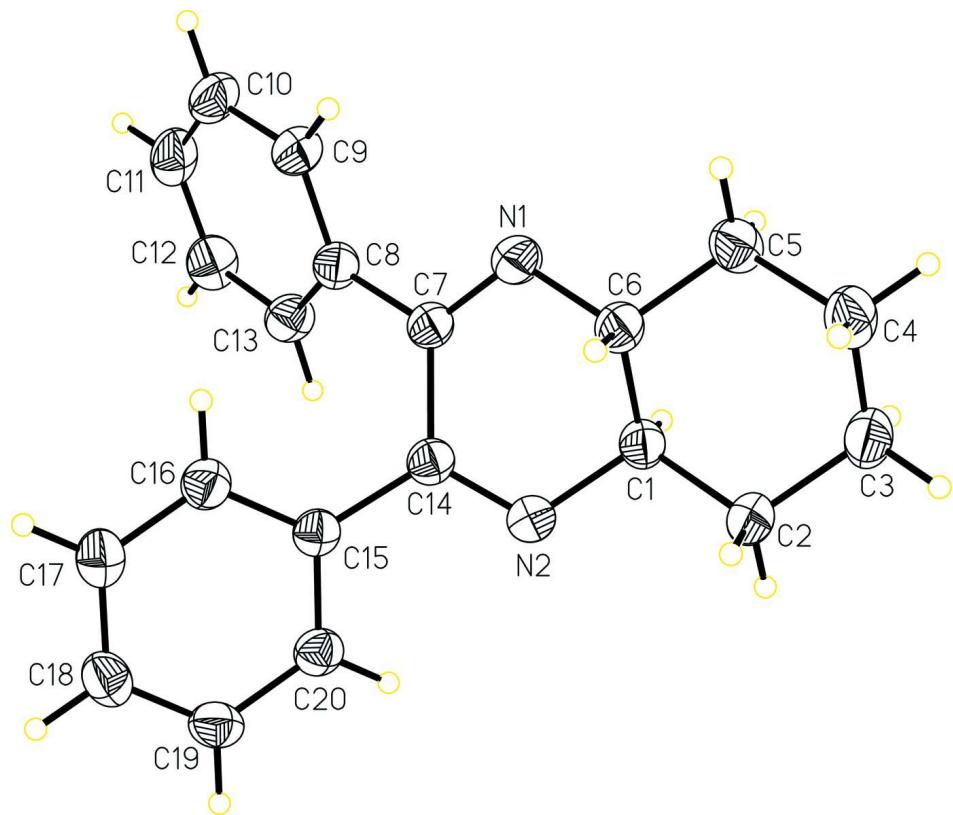

Presence of chiral centres in organic ligands is important for synthesis of chiral coordination polymers (Qu *et al.*, 2004). We report here the crystal structure of (4a*R*,8a*R*)-4a,5,6,7,8,8a-hexahydro-2,3-diphenylquinoxaline (Fig. 1).

S2. Experimental

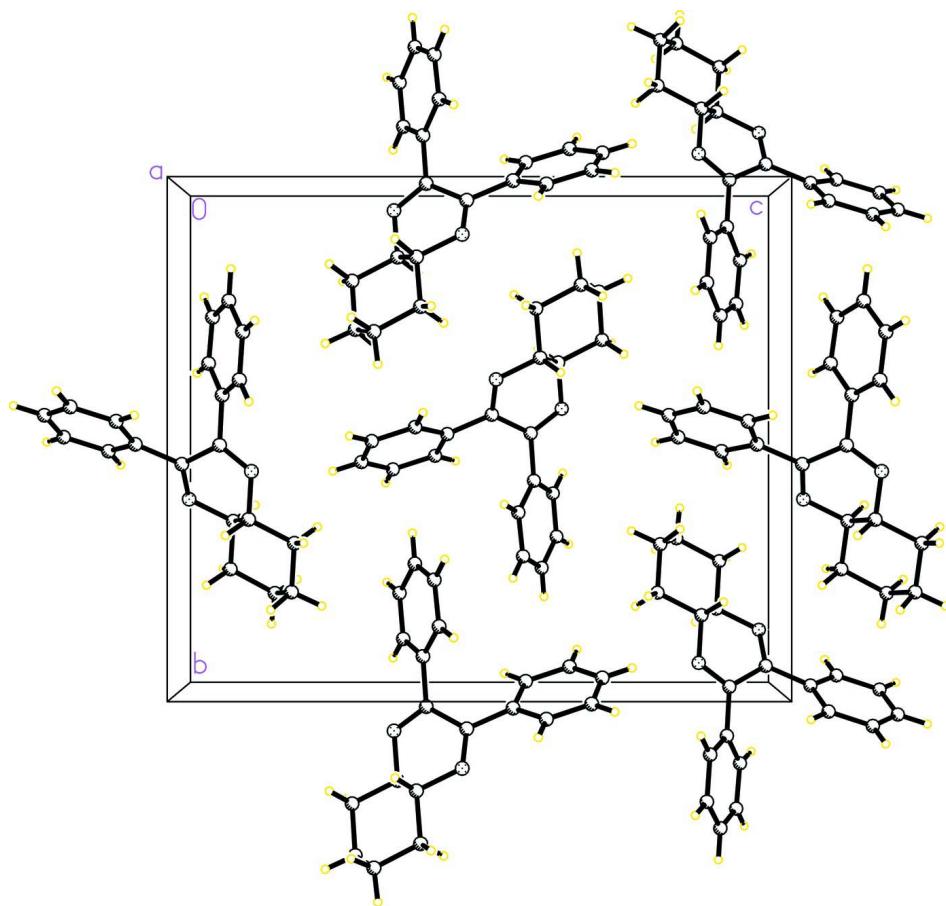

Benzil (2.10 g, 10.0 mmol) and (1*R*,2*R*)-(-)-diaminocyclohexane (1.20 g, 10.5 mmol) were dissolved in methanol (20 ml) containing sulfuric acid (0.08 g) as a catalytic agent. The solution was stirred at room temperature. After 4 h, a yellow precipitate appeared. It was filtered off and washed with chilled methanol (10 ml). The crude product was recrystallized by slow evaporation of the saturated ethanol solution. Yellow block-like crystals with dimensions of tenths of mm were isolated.

S3. Refinement

All the H atoms could be found in the difference Fourier maps. Nevertheless, they were placed into the idealized positions and refined in a riding atom approximation with following constraints: C_{methine}—H_{methine} = 0.98; C_{methylene}—H_{methylene} = 0.97; C_{aryl}—H_{aryl} = 0.93 Å; $U_{\text{iso}}\text{H} = 1.2U_{\text{eq}}\text{C}$ in all the cases. In the absence of significant anomalous scattering effects, 1531 Friedel pairs were merged. The absolute configuration was determined by synthesis. The chiral reactant (1*R*,2*R*)(-) diaminocyclohexane was used.

 $\Delta\rho_{\min} = -0.13 \text{ e } \text{\AA}^{-3}$
Extinction correction: *SHELXL97* (Sheldrick, 1997), $F_c^* = kF_c[1 + 0.001x F_c^2 \lambda^3 / \sin(2\theta)]^{-1/4}$
Extinction coefficient: 0.010 (2)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
