Received 14 December 2007; accepted 31 January 2008

Key indicators: single-crystal X-ray study;  $T = 298$  K; mean  $\sigma(\text{S-O}) = 0.005$  Å; H-atom completeness 60%; disorder in main residue;  $R$  factor = 0.032;  $wR$  factor = 0.044; data-to-parameter ratio = 6.1.

The title compound, sodium ammonium sulfate–telluric acid (1/1),  $\text{Na}_{0.39}(\text{NH}_4)_{1.61}\text{SO}_4\cdot\text{Te}(\text{OH})_6$ , is isostructural with other solid solutions in the series  $M_{1-x}(\text{NH}_4)_x\text{SO}_4\cdot\text{Te}(\text{OH})_6$ , where ammonium is partially replaced with an alkali metal ( $M = \text{K}$ ,  $\text{Rb}$  or  $\text{Cs}$ ). The structure is composed of planes of  $\text{Te}(\text{OH})_6$  octahedra alternating with planes of  $\text{SO}_4$  tetrahedra. The  $\text{Na}^+/\text{NH}_4^+$  cations are statistically distributed over the same position and are located between the planes. The structure is stabilized by  $\text{O}-\text{H}\cdots\text{O}$  and  $\text{N}-\text{H}\cdots\text{O}$  hydrogen bonds between the telluric acid adducts and the O atoms of sulfate groups, and between the ammonium cations and O atoms, respectively. Both Te atoms lie on centres of symmetry.

## Related literature

For the sodium end-member of the solid solution series  $\text{Na}_{1-x}(\text{NH}_4)_x\text{SO}_4\cdot\text{Te}(\text{OH})_6$ , see: Zilber *et al.* (1980). For the ammonium end-member of the same series, see: Zilber *et al.* (1981). For other solid solutions in the system  $M_{1-x}(\text{NH}_4)_x\text{SO}_4\cdot\text{Te}(\text{OH})_6$ , where ammonium is partially replaced by an alkali metal, see: Dammak *et al.* (2005) for  $M = \text{Cs}$ ; Ktari *et al.* (2002) for  $M = \text{Rb}$ ; and Ktari *et al.* (2004) for  $M = \text{K}$ . For related literature, see: Prince (1982); Watkin (1994).

## The solid solution $\text{Na}_{0.39}(\text{NH}_4)_{1.61}\text{SO}_4\cdot\text{Te}(\text{OH})_6$

L. Ktari, M. Abdelhedi, M. Dammak, A. Cousson and A. Kolsi

### Comment

The studies of a partial cationic substitution on symmetry and physical properties of solid solutions in the series  $M_{1-x}(\text{NH}_4)_x\text{SO}_4\cdot\text{Te}(\text{OH})_6$  ( $M = \text{K}, \text{Rb}$  and  $\text{Cs}$ ) have been reported in previous communications, *viz.* for  $\text{K}_{0.84}(\text{NH}_4)_{1.16}\text{SO}_4\cdot\text{Te}(\text{OH})_6$  (Ktari *et al.*, 2004),  $\text{Rb}_{1.12}(\text{NH}_4)_{0.88}\text{SO}_4\cdot\text{Te}(\text{OH})_6$  (Ktari *et al.*, 2002), and  $\text{Cs}_{0.86}(\text{NH}_4)_{1.14}\text{SO}_4\cdot\text{Te}(\text{OH})_6$  (Dammak *et al.*, 2005). To continue these studies, we have now investigated the solid solution  $\text{Na}_{0.39}(\text{NH}_4)_{1.61}\text{SO}_4\cdot\text{Te}(\text{OH})_6$ . This compound is isostructural with the aforementioned phases.

Fig. 1 shows a projection of the structure on the *ab* plane. The structure can be regarded as being built up of planes of  $\text{Te}(\text{OH})_6$  octahedra (at  $x = 0$  and  $1/2$ ) alternating with planes of  $\text{SO}_4$  tetrahedra (at  $x \approx 1/4$ ). The statistically disordered  $\text{Na}^+/\text{NH}_4^+$  cations are intercalated between these planes. Both Te atoms are situated on inversion centres and exhibit similar  $\text{Te}(\text{OH})_6$  octahedra, with Te—O distances and O—Te—O angles ranging from 1.903 (6) to 1.916 (3) Å, and from 87.6 (2) to 92.4 (2)°, respectively (Fig. 2). In the sodium end-member  $\text{Na}_2\text{SO}_4\cdot\text{Te}(\text{OH})_6$  (Zilber *et al.*, 1980), the Te—O distances range from 1.879 (4) to 1.932 (3) Å, whereas in the ammonium end-member  $(\text{NH}_4)_2\text{SO}_4\cdot\text{Te}(\text{OH})_6$  (Zilber *et al.*, 1981) they vary from 1.874 (3) to 1.944 (3) Å. The  $\text{SO}_4$  tetrahedra in the title compound are quite regular with S—O distances between 1.460 (6) and 1.486 (6) Å and O—S—O angles between 108.6 (3) and 110.6 (3)°. In the sodium end-member, the S—O distances are nearly the same (1.461 (5) to 1.497 (5) Å), whilst in the ammonium end-member they spread between 1.373 (11) and 1.565 (8) Å. In the mixed solution the Na/N atoms are 9-coordinate with (Na/N)—O bonds ranging from 2.873 (4) to 3.278 (5) Å for  $\text{Na}_1/\text{N}_1$  and from 2.938 (5) to 3.305 (6) Å for  $\text{Na}_2/\text{N}_2$ . Thereby every cation is coordinated by three oxygen atoms belonging to  $\text{SO}_4$  tetrahedra and by six oxygen atoms belonging to  $\text{Te}(\text{OH})_6$  octahedra. The structure of the title compound is stabilized *via* medium-strong O—H···O hydrogen bonds between the  $\text{Te}(\text{OH})_6$  octahedra and  $\text{SO}_4$  tetrahedra (Fig. 3), and between N—H···O hydrogen bonds between the ammonium cations and various oxygen atoms in the structure (see hydrogen bonding Table).

### Experimental

Transparent, colorless single crystals of the title compound were grown from an aqueous solution consisting of a stoichiometric mixture (ratio 1:1.5:0.5) of  $\text{H}_6\text{TeO}_6$  (Aldrich, 99%)  $(\text{NH}_4)_2\text{SO}_4$  (Aldrich, 99.99%) and  $\text{Na}_2\text{SO}_4$  (Aldrich, 99%) after evaporation at room temperature.

### Refinement

H atoms of the  $\text{Te}(\text{OH})_6$  group were located in an electron density difference map and were refined with O—H distance restraints of 0.95 (2) Å and a common  $U_{\text{iso}}$  parameter. H atoms of the ammonium groups could not be located and were excluded from the refinement. For the refinement of the occupation factors for N and Na atoms, their sums were restrained

# supplementary materials

to be equal to 1. The highest peak in the final Fourier map is located 0.044 Å from Te2 and the deepest hole 0.43 Å from the same atom.
