Received 6 December 2007; accepted 13 April 2008

Key indicators: single-crystal X-ray study;  $T = 293\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$ ;  $R$  factor = 0.052;  $wR$  factor = 0.156; data-to-parameter ratio = 25.7.

In the title compound,  $\text{C}_{25}\text{H}_{23}\text{NO}$ , the indoline system is essentially planar. The molecular structure is stabilized by weak intramolecular  $\text{C}-\text{H}\cdots\text{N}$  interactions and the crystal packing is determined by intermolecular  $\text{C}-\text{H}\cdots\pi$  interactions.

### S1. Comment

Indole compounds can be used as bioactive drugs (Stevenson *et al.*, 2000). Indole derivatives exhibit anti-allergic, central nervous system depressant and muscle relaxant properties (Harris & Uhle, 1960; Ho *et al.*, 1986). Indoles have also been proved to display high aldose reductase inhibitory activity (Rajeswaran *et al.*, 1999). In view of this biological importance, an X-ray study of the title compound, (I), was carried out.

An ORTEP (Farrugia, 1997) plot of the molecular is shown in Fig. 1. The indole moiety is planar [maximum deviation of 0.038 (1) from the least square plane defined by all non hydrogen atoms in the molecule] and is nearly orthogonal to methylphenyl rings A and B, and makes a dihedral angle of 72.3 (4) $^{\circ}$  with the ring A, 76.7 (3) $^{\circ}$  with the ring B. Both the *p*-tolyl rings A and B are oriented at an angle of 72.6 (4) $^{\circ}$  with respect to each other. The sum of angles around N1 [360.0] $^{\circ}$  is in accordance with  $sp^2$  hybridization. The endocyclic angles around C4 is narrowed while those at C9 is widened from 120 $^{\circ}$ . This may be caused by fusion of the smaller pyrrole ring to the six membered benzene ring of oxindole. A similar effect has also been observed by Sethu Sankar *et al.* (2002). The bond lengths in the oxindole ring systems indicate electron delocalization. The torsion angles C19—C16—C15—C14 [-179.5 (2) $^{\circ}$ ], C19—C16—C17—C18 [179.7 (2) $^{\circ}$ ] and C26—C23—C24—C25 [-179.6 (2) $^{\circ}$ ], C26—C23—C22—C21 [179.8 (2) $^{\circ}$ ] indicates that the methyl groups are coplanar with the plane of the attached benzene rings A and B. The allyl group deviates significantly from the plane of the indole moiety [C12—C11—C10—N1 = -4.5 (3) $^{\circ}$ ].

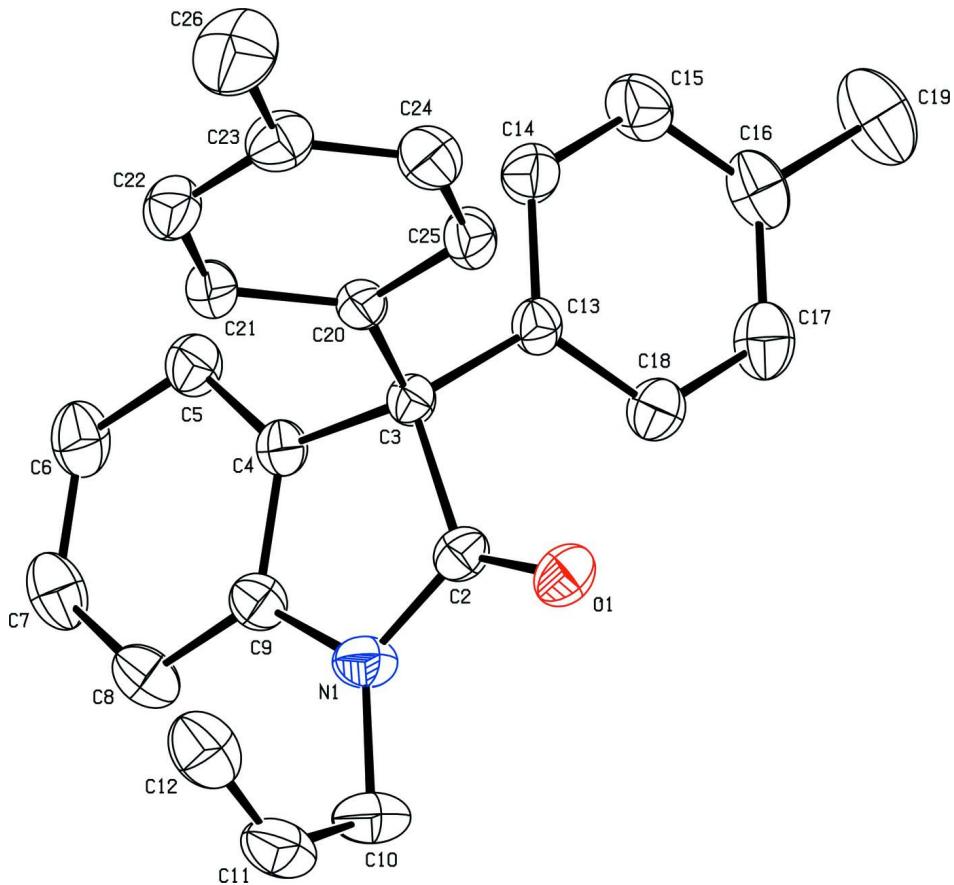

Weak intramolecular C—H···N and intermolecular C—H···Cg interactions, with C5···Cg = 3.740 (2) Å, [Cg denotes centroid of C20—C25 ring] are observed in the molecular structure. In addition the packing is stabilized by van der Waals forces.

### S2. Experimental

To a solution of *p*-methyl phenyl magnesium bromide in dry THF, at 0°C under N<sub>2</sub> atm., 1-*N*-allyl isatin (0.0125 mol, 2.34 g), in dry THF, was added dropwise. After the complete addition, the mixture was stirred at 0°C for 1 hr and then it was stirred at room temperature for 5 hrs. On completion of the reaction, a saturated solution of NH<sub>4</sub>Cl was added slowly at 0°C. The aqueous layer was extracted with ether, and the combined organic layer was extracted with ether. The crude mass was obtained., which was purified over a column of silica gel using hexane/ethyl acetate as eluent. Compound was recrystallized from methanol.

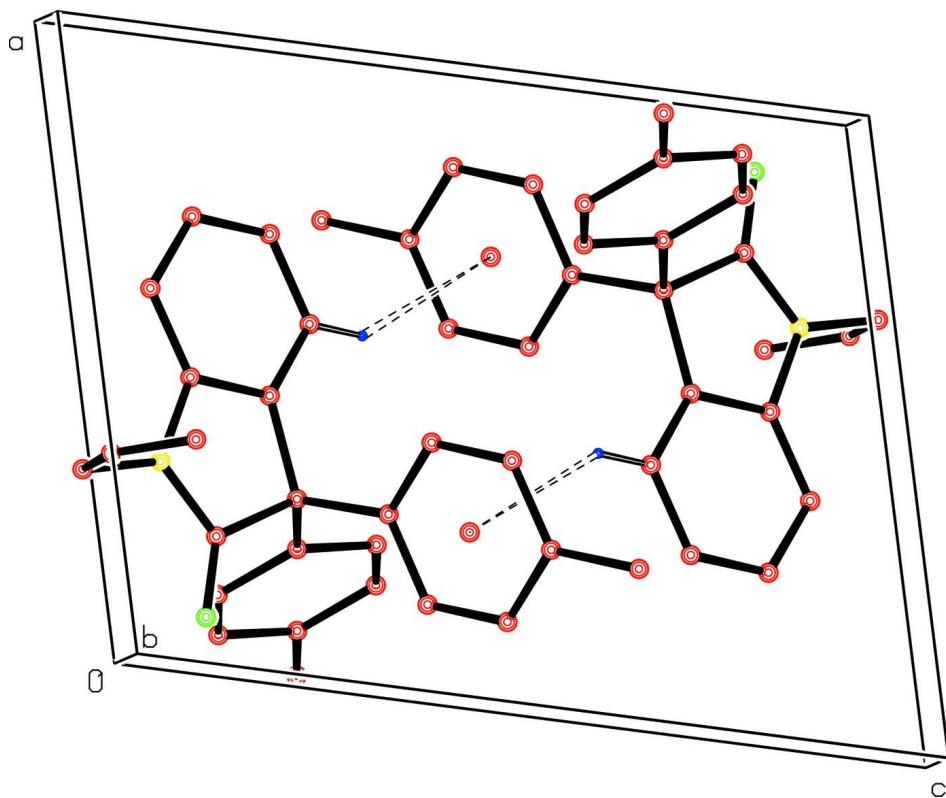

### S3. Refinement

H atoms were positioned geometrically and were treated as riding on their parent C atoms, with aromatic C—H distances of 0.93 Å, methyl C—H distances of 0.96 Å and methylene C—H distances of 0.97 Å, and with  $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C})$  for methyl H and  $1.2U_{\text{eq}}(\text{C})$  for other H atoms.

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
