Received 22 December 2007; accepted 7 April 2008

Key indicators: single-crystal X-ray study;  $T = 293$  K; mean  $\sigma(\text{C}-\text{C}) = 0.003$  Å;  $R$  factor = 0.051;  $wR$  factor = 0.142; data-to-parameter ratio = 15.7.

In the title compound,  $\text{C}_{23}\text{H}_{19}\text{NO}$ , the oxindole residue is essentially planar and is almost perpendicular to the phenyl rings [dihedral angles =  $72.1$  (6) and  $77.6$  (6) $^\circ$ ]. The molecular packing is stabilized by  $\text{C}-\text{H}\cdots\text{O}$  hydrogen bonds and  $\text{C}-\text{H}\cdots\text{N}$  interactions.

## 1-Allyl-3,3-diphenylindolin-2-one

S. Nirmala, E. T. S. Kamala, L. Sudha, A. R. N. Raj and C. A. M. A. Huq

### Comment

Indole and its derivatives form a class of toxic recalcitrant N – heterocyclic compounds that are considered as pollutants (Florin *et al.*, 1980). Derivatives of indole have received much attention because of their widespread applications in materials science, agrichemicals, and pharmaceuticals (Ramirez & Garcia-Rubio, 2003). Their preparation and functionalization continues to be a fascinating subject in organic synthesis due to the frequent appearance of indoles in biologically interesting compounds (Bandini *et al.*, 2005). Compounds containing the indole moiety have been proven to display high activity of aldose reductase inhibition (Rajeswaran *et al.*, 1999). In view of this importance, an X-ray study of the title compound, (I), was carried out.

An ORTEP (Farrugia, 1997) plot of the molecule is shown in Fig. 1. The indole moiety (N1/C2 – C9) is planar with the maximum deviation of 0.040 (8) for C2 atom. The oxindole ring is nearly orthogonal to phenyl rings A (C13 – C18) and B (C19 – C24), and makes a dihedral angle of 72.1 (6)° with the ring A, 77.6 (6)° with the ring B. Both the phenyl rings A and B are oriented at an angle of 70.4 (7)° with respect to each other. The sum of angles at N1 [360.0]° indicate  $sp^2$  hybridization. In the oxindole ring systems, the variation in endocyclic angles are due to fusion of five and six membered rings (Govind *et al.*, 2003). The N1—C2 and C2—O1 bond lengths indicate electron delocalization over atoms N1, C2 and O1. The torsion angle C12—C11—C10—N1 = -0.3 (4)° indicate that the allyl group deviates significantly from the plane of the attached indole moiety.

Weak intramolecular C—H···N and C—H··· $\pi$  interactions stabilize the molecule. The crystal packing also involves intermolecular C—H···O interactions and van der Waals forces.

### Experimental

To a solution of phenyl magnesium bromide in dry THF, at 0°C under N<sub>2</sub> atm., 1-*N*-allyl isatin (0.005 mol, 0.935 g), in dry THF, was added dropwise. After the complete addition, the mixture was stirred at 0°C for 1 hr and then it was stirred at room temperature for 5 hrs. The progress of the reaction was followed by TLC. On completion of the reaction, a saturated solution of NH<sub>4</sub>Cl was added slowly at 0°C. The aqueous layer was washed with brine (50 ml) and dried. On removal of the solvent under reduced pressure, a crude mass was obtained., which was purified over a column of silica gel (100–200 mesh) using hexane/ethyl acetate as eluent. Compound was recrystallized from methanol.

### Refinement

H atoms were placed in idealized positions and allowed to ride on their parent atoms with aromatic C—H distances of 0.93 Å, methylene C—H distances of 0.97 Å and with  $U_{iso}(H) = 1.2 U_{eq}(C)$ . In the absence of significant anomalous scattering effects, Friedel pairs have been merged. The absolute structure parameter is removed from the CIF since the Flack [10.0 (10)] is meaningless.

Refinement

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.050$	H-atom parameters constrained
$wR(F^2) = 0.142$	$w = 1/[\sigma^2(F_o^2) + (0.0653P)^2 + 0.2107P]$
$S = 1.09$	where $P = (F_o^2 + 2F_c^2)/3$
3559 reflections	$(\Delta/\sigma)_{\max} < 0.001$
226 parameters	$\Delta\rho_{\max} = 0.31 \text{ e } \text{\AA}^{-3}$
Primary atom site location: structure-invariant direct methods	$\Delta\rho_{\min} = -0.21 \text{ e } \text{\AA}^{-3}$
	Extinction correction: none

Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
