Received 12 April 2008; accepted 23 April 2008
Key indicators: single-crystal X-ray study; $T=173 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.003 \AA$; Hatom completeness $99 \%$; disorder in solvent or counterion; $R$ factor $=0.043$; $w R$ factor $=0.108 ;$ data-to-parameter ratio $=16.8$.

The title compound, $\mathrm{C}_{9} \mathrm{H}_{10} \mathrm{~N}_{4} \mathrm{~S} \cdot 0.095 \mathrm{H}_{2} \mathrm{O}$, consists of discrete 4-ethyl-3-(3-pyridyl)-1 H-1,2,4-triazole-5(4H)-thione molecules and a disordered molecule of water of hydration with partial occupancy, lying on a twofold rotation axis. The dihedral angle between the pyridine and triazole rings is 41.73 (8) ${ }^{\circ}$. In the crystal structure, molecules are hydrogen bonded via triazole NH groups and pyridyl N atoms, forming chains parallel to the $a$ axis.

## S1. Comment

Disubstituted 1,2,4-triazoles and their derivatives are very important five membered heterocyclic compounds for their biological and pharmacological activities, such as antitumoral, inhibition of cholesterol, fungicidal, herbicidal, anticonvulsant (Kanazawa et al., 1988; Chai et al., 2003; Hashimoto et al., 1990). Herein, we report the synthesis and crystal structure of the title compound, (I).
The structure of (I) is composed of independent molecules of 4-ethyl-2,4-dihydro-5-(3-pyridyl)-3H-1,2,4-triazole-3thione (Fig. 1) and a disordered water of hydration with partial occupancy lying on a two-fold rotation axis. The bond distances and bond angles in (I) agree well with the corresponding bond distances and angles reported in some compounds closely related to (I) (e.g., Dege et al., 2004, 2005; Mazur et al., 2006; Dobosz et al., 2003; Demir, et al., 2006). The mean-planes formed by the pyridyl and triazole rings in (I) lie at 41.73 ( 8$)^{\circ}$ with respect to each other while the mean-plane of the ethyl group is inclined with the triazole ring at $80.39(13)^{\circ}$.
The water of hydration is surrounded by four molecules of (I) with $\mathrm{S} 1 \cdots \mathrm{O} 1$ and $\mathrm{N} 1 \cdots \mathrm{O} 1$ separation of 3.074 (4) and 3.382 (9) $\AA$, respectively (Fig. 2). The molecules of (I) are hydrogen bonded via $\mathrm{N} 2-\mathrm{H} 2 \cdots \mathrm{~N} 4$ forming chains lying parallel to the $a$ axis (details of hydrogen bonding geometry have been given in Table 1). The shortest distance between the centroids of pyridyl and triazole rings from two different molecules lying about inversion centers is 4.350 (3) $\AA$.

## S2. Experimental

The title compound was prepared from the corresponding thiosemicarbazide by following the reported procedure (Ahmad et al., 2001). 4-Ethyl-1-(2-pyridoyl)thiosemicarbazide ( 12 mmol ) was dissolved in an aqueous 4 N sodium hydroxide solution ( 65 ml ). The solution was heated to reflux for 11.5 h , cooled and filtered. The filtrate was acidified to pH of $4-5$, with 4 N hydrochloric acid. The solid product was filtered off, washed with water and recrystallized from aqueous ethanol ( $60 \%$ ). Crystals of (I) were grown by slow evaporation of the ethanol over 15 days at room temperature (yield $72 \%$ ).

## S3. Refinement

Though all the H atoms could be distinguished in the difference Fourier map the H -atoms bonded to C -atoms were included at geometrically idealized positions and refined in riding-model approximation with the following constraints: pyridyl, methyl and methylene $\mathrm{C}-\mathrm{H}$ distances were set to $0.95,0.98$ and $0.99 \AA$, respectively; in all these instances $U_{\mathrm{iso}}(\mathrm{H})=1.2 U_{\mathrm{eq}}(\mathrm{C})$. H-atom bonded to N 2 was taken from the difference map and was allowed to refine with $U_{\mathrm{iso}}=1.2$ times $U_{\text {eq }}$ of N 2 . Towards the end of the refinement, a difference Fourier map revealed a peak that was included in the refinement as an O -atom the site occupancy factor of which refined to 0.095 ; its s.o.f. was fixed at that value during the final rounds of calculations. The H -atoms bonded to the O atom of the water molecule could not be located and were not included in the refinement but are included in the molecular formula. The atmospheric moisture was assumed to be the
source of this partially occupied water of hydration. The final difference map was free of any chemically significant features.

Figure 1
ORTEP-3 (Farrugia, 1997) drawing of (I) with displacement ellipsoids plotted at 50\% probability level.

Figure 2
Unit cell packing of (I) showing hydrogen bonds with dashed lines; H -atoms not involved in H -bonds have been omitted.

$\Delta \rho_{\text {max }}=0.24 \mathrm{e}_{\AA^{-3}}$
$\Delta \rho_{\text {min }}=-0.25$ e $\AA^{-3}$
Extinction correction: SHELXL97 (Sheldrick, 2008), $\mathrm{Fc}^{*}=\mathrm{kFc}\left[1+0.001 \mathrm{xFc}^{2} \lambda^{3} / \sin (2 \theta)\right]^{-1 / 4}$

Extinction coefficient: 0.0038 (9)

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors $(\mathrm{gt})$ etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
