

(R)-(-)-3-Hydroxyquinuclidinium chloride

Miłosz Siczek* and Tadeusz Lis

Faculty of Chemistry, University of Wrocław, 14 Joliot-Curie St, 50-383 Wrocław, Poland

Correspondence e-mail: milosz@eto.wch.uwr.pl

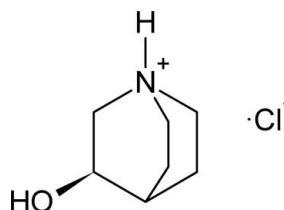

Received 20 March 2008; accepted 4 April 2008

Key indicators: single-crystal X-ray study; $T = 100\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$; R factor = 0.026; wR factor = 0.064; data-to-parameter ratio = 36.0.

The quinuclidinium cation of the title compound, $\text{C}_7\text{H}_{14}\text{NO}^+ \cdot \text{Cl}^-$, shows a twist along the C–N pseudo-threefold axis, with N–C–C–C torsion angles of $-16.0(1)$, $-16.9(1)$ and $-15.6(1)^\circ$. The crystal structure is stabilized by N–H···Cl and O–H···Cl hydrogen bonds, forming infinite chains along the a and b axes.

(R)-(-)-3-Hydroxyquinuclidinium chloride

Miłosz Siczek and Tadeusz Lis

S1. Comment

Since the first synthesis of potassium μ -oxo-bis[pentachlororhenate(IV)] (Noddack & Noddack, 1933) numerous efforts have been undertaken to quantitatively describe its structure. To the present day only one structure of $[\text{Re}_2\text{OCl}_{10}]^4-$ with potassium cations and one of its oxidized form, $[\text{Re}_2\text{OCl}_{10}]^{3-}$, with caesium cations have been successfully determined by X-Ray crystallography (Morrow, 1962; Lis & Jeżowska-Trzebiatowska, 1976; Lis *et al.*, 1975;). Our structural studies on $[\text{Re}_2\text{OCl}_{10}]^4-$ and $[\text{Re}_2\text{OCl}_{10}]^{3-}$ have shown that the appropriate choice of cation is crucial to obtain good structural parameters for the anion unit. The most suitable properties of the cation are low symmetry, chirality and the ability to form hydrogen bonds. All these requirements are fulfilled by (R)-(-)-3-hydroxyquinuclidinium cation. Quinuclidinium derivatives have been of interest due to their biological activity, especially as a acetylcholinesterase inhibitor (Bosak *et al.*, 2005). It was also proven that quinuclidinium salts protected rats against the toxicity of soman and tabun (Sterling *et al.*, 1988). Aside from the present study, the only other known structure of (R)-(-)-3-hydroxyquinuclidinium was with (R,R)-tartrate anion (Erman *et al.*, 1994).

The asymmetric unit of the crystal (Fig. 1) consists of a (R)-(-)-3-hydroxyquinuclidinium cation and a chloride anion. The quinuclidine moiety has almost exact threefold symmetry about N1—C4, and the two subunits (N1, C2, C6, C7 and C4, C3, C5, C8) are twisted about this axis. The deformation of quinuclidinium cation is reflected in the values of the N1—C2—C3—C4, N1—C6—C5—C4, N1—C7—C8—C4 torsion angles, which are -16.0 (1) $^\circ$ -16.9 (1) $^\circ$ -15.6 (1) $^\circ$, respectively. Similar rotation has also been observed, but with slightly smaller angles, in 3-hydroxyquinuclidinium tartrate (Erman *et al.*, 1994). The bond lengths of the cation are all normal and are in good agreement with quinuclidinium derivatives (Carroll *et al.*, 1991; Erman *et al.*, 1994; Frackenpohl & Hoffmann, 2000). The anion is surrounded by six symmetry-related cations that act as hydrogen bond acceptors for O—H and N—H groups. The hydrogen bonds link cations and anions into infinite chains running in the *a* and *b* axis directions (Figs. 2,3).

S2. Experimental

The title compound was obtained from a commercial source (Aldrich) and dissolved in hot methanol. Colourless crystals grew from the solution after a few hours.

S3. Refinement

The H atoms firstly were all located in difference maps, then set in calculated positions and refined as riding atoms [C—H = 0.99–1.00 Å, O—H = 0.84 Å and $U_{\text{iso}}(\text{H}) = 1.2\text{U}_{\text{eq}}(\text{C})$ or $1.5\text{U}_{\text{eq}}(\text{O})$].

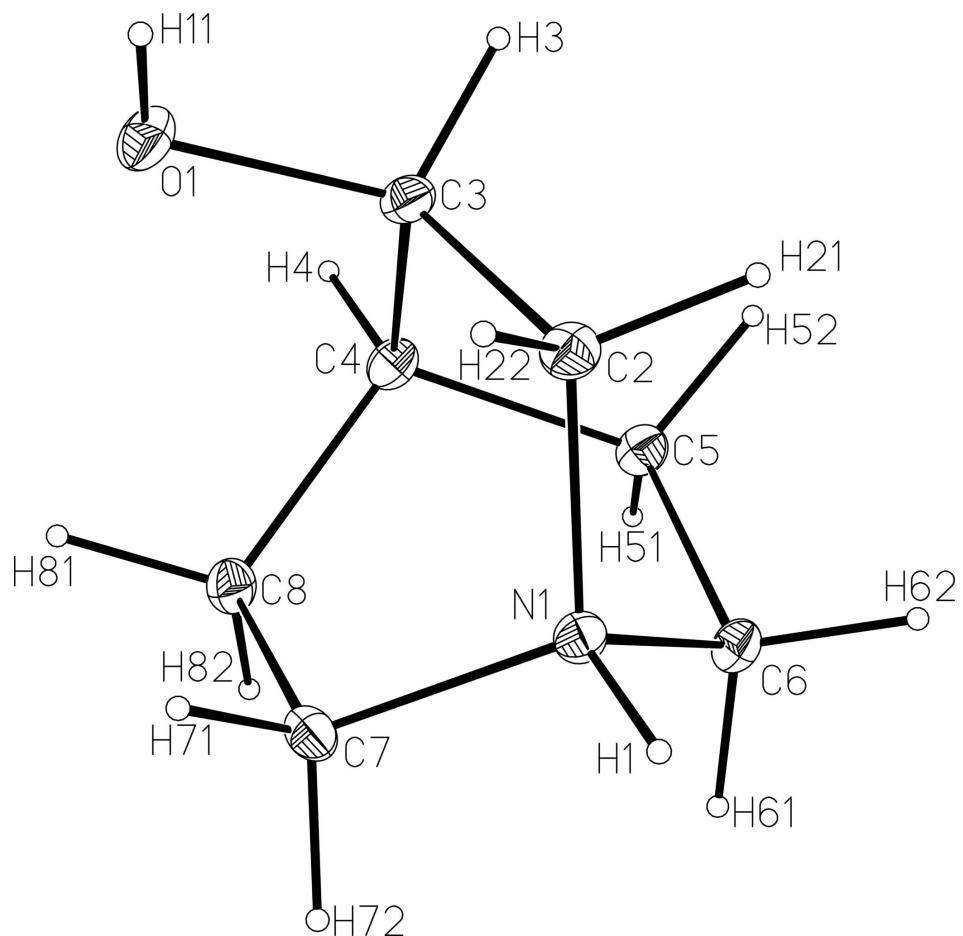

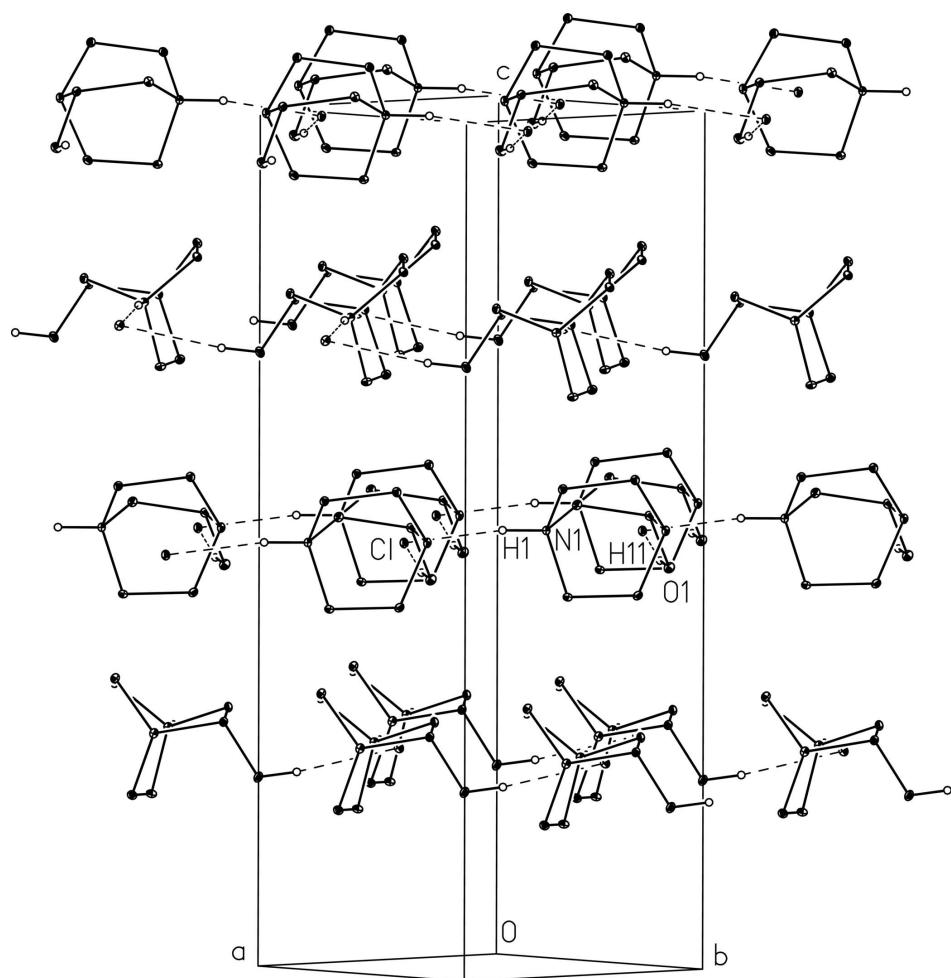

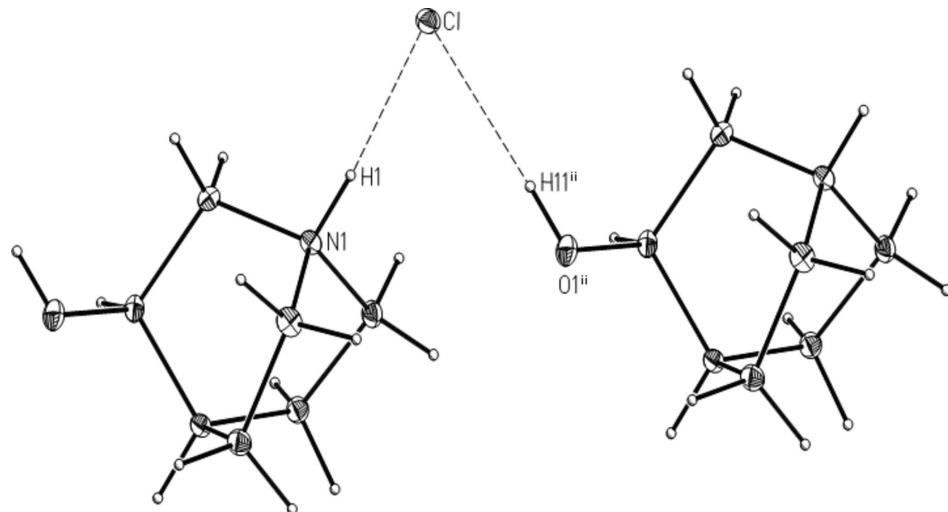

Figure 1

A view of (*R*)-(-)-3-hydroxyquinuclidinium cation with atom labelling scheme. The thermal displacement ellipsoids are drawn at 30% probability level.

**Figure 2**

A view of molecular packing showing chains formed along *a* and *b* directions. The hydrogen bonds are shown as dashed lines. The H atoms not involved in any interaction are omitted for clarity.

**Figure 3**

A view of (*R*)-(-)-3-hydroxyquinuclidinium cations and chloride anion forming hydrogen bonds. The thermal displacement ellipsoids are drawn at 30% probability level. Symmetry code: [ii] $x + 1, y, z$.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
