Received 12 April 2008; accepted 29 April 2008

Key indicators: single-crystal X-ray study; $T = 296\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; R factor = 0.044; wR factor = 0.120; data-to-parameter ratio = 19.7.

The title compound, $C_{17}H_{14}Cl_2N_2O_3S_2$, and the 4-methoxyanilino analogue reported in the following paper have been used as starting materials to develop benzothiazine derivatives with antimalarial activity. The molecule displays an *E* (*trans*) configuration about the central double bond. Due to conjugation in the $\text{C}=\text{C}-\text{C}\equiv\text{N}$ group, the putative single bond shows a significant shortening [1.421 (3) \AA]. The molecule has a six-membered ring involving an intramolecular $\text{N}-\text{H}\cdots\text{O}(\text{sulfonyl})$ bond, which is an example of resonance-assisted hydrogen bonding. There is also an intramolecular $\text{N}-\text{H}\cdots\text{Cl}$ hydrogen bond. In the crystal structure, bonds of the $\text{C}-\text{H}\cdots\text{O}(\text{sulfonyl})$ type form chains that run along [101], while $\text{N}-\text{H}\cdots\text{O}(\text{sulfonyl})$ bonds connect centrosymmetrically related molecules in pairs of these chains, forming ribbons. Comparison of the $\text{N}\cdots\text{O}$ distances in the intra- and intermolecular $\text{N}-\text{H}\cdots\text{O}(\text{sulfonyl})$ bonds reveals that the π -bond co-operativity results in a strengthening of the intramolecular hydrogen bond. There are also $\pi-\pi$ interactions between benzene rings of pairs of centrosymmetrically related molecules [centroid–centroid distance = 3.8612 (13) \AA], as well as $\text{C}-\text{H}\cdots\pi$ interactions.

Mario V. Capparelli, Arthur R. Barazarte and Jaime E. Charris

S1. Comment

The exploration of simple molecules with different functionalities for the synthesis of heterocycles is a worthwhile contribution to the chemistry of these compounds. The title compound (I), the 4''-methyl analogue (II) [see next paper: Capparelli *et al.*, 2008)], and similar derivatives, have been used as effective synthons in the syntheses of some 1H-pyrrole-2,5-diones (Tominaga *et al.*, 2002), pyrimidine derivatives (Tominaga *et al.*, 1989) and 4H-1,4-benzothiazine-1,1-dioxides (Charris *et al.*, 2005). We used (I) and (II) as starting materials to develop benzothiazine derivatives with antimalarial activity (Charris *et al.*, 2007; Barazarte *et al.*, 2008).

The X-ray structure determination showed that there is one molecule per asymmetric unit (Fig. 1), which displays E (*trans*) configuration about the C2=C3 double bond. A search of the Cambridge Structural Database (version 5.29, updated Jan 2008) (Allen, 2002) produced no structures with the same central fragment (*i.e.* excluding the phenyl rings) of (I) for proper comparison, but a search for the more restricted fragment X—C(CN)=C(SMe)—N(H)—Y gave three comparable structures, *viz.* TAKDOZ (Krivokolysko *et al.*, 2002), AJULUM (Kennard *et al.*, 2003) and DALVES (Song *et al.*, 2005). Due to conjugation in the C3=C2—C1≡N1 moiety, the putative single bond C2—C1 shows a significant shortening, similar to the range 1.415 (7)–1.437 (4) Å observed in the aforementioned structures. Bond lengths (see Supplementary Materials) are in good agreement with the tabulated values (Allen *et al.*, 1987), except C24—C25 (1.359 (4) Å), which is *ca* 0.02 Å shorter than expected.

The title compound displays a six-membered ring involving an intramolecular N—H···O(sulfonyl) bond (Table 1), which is an example of resonance-assisted hydrogen bonding (RAHB) (Gilli *et al.*, 1989), as suggested by the ring bond lengths. Comparison with AJULUM and DALVES, which display similar rings [with N—H···O(carbonyl) and N—H···O(carboxyl) bonds respectively] and TAKDOZ, which does not have RAHB, reveal lengthenings of the C=C distances [AJULUM, 1.371 (2) Å; DALVES, 1.386 (7) Å; TAKDOZ, 1.345 (4) Å] and shortenings of the C—N bonds [AJULUM, 1.360 (2) Å; DALVES, 1.333 (6) Å; TAKDOZ, 1.404 (4) Å]. The situation is less clear in the S=O bond, with S1=O2 (involved in RAHB) just significantly longer than S1=O1. In addition to the RAHB ring, there is an N—H···Cl intramolecular bond. The molecular geometry also allows for a possible C4—H4b···Cg2 intramolecular interaction (Cg2: see below).

In the crystal structure (Fig. 2) bonds of the C—H···O(sulfonyl) type form chains that run along [1 0 1], while N—H···O(sulfonyl) bonds connect centrosymmetrically related atoms of pairs of these chains, to form ribbons. Comparison of the N···O distances of the intra- and intermolecular N—H···O(sulfonyl) bonds reveals that the π-bond cooperativity results in a strengthening of the intramolecular hydrogen bond, as indicated by the significant shortening of the corresponding N···O distance. There are also π-π interactions between phenyl rings of pairs of centrosymmetrically related molecules, with Cg1···Cg2(2 - *x*, 1 - *y*, -*z*), 3.8612 (13) Å (Cgm: centroid of ring Cm1—Cm6, *m* = 1, 2).

S2. Experimental

To a solution of 2,4-dichlorobzenosulfonylacetonitrile (1.50 g, 6.1 mmol) and KOH (0.46 g, 8.1 mmol) in anhydrous dioxane (10 ml) at 0 °C, was added dropwise 3-methoxyphenylisothiocianate (1.00 g, 6.1 mmol) dissolved in anhydrous dioxane (3 ml). The resulting solution was stirred for 4 h at room temperature and then was added iodomethane (0.87 g, 6.1 mmol) and the mixture was stirred by 5 h at room temperature. The solvent was removed under reduced pressure and the residue was dissolved in dichloromethane (20 ml), washed with water, brine, dried over anhydrous sodium sulfate, filtered and concentrated to dryness. The solid was purified by recrystallization from ethanol. Yield: 1.91 g (74%).

Crystals suitable for X-ray analysis were obtained during the recrystallization.

The IR spectrum was determined on a Shimadzu model 470 spectrophotometer. IR data [KBr pellets, ν (cm⁻¹)]: 3264 (NH), 2192 (CN), 1341 (SO₂), 1133 (SO₂).

The ¹H NMR spectrum was recorded using a Jeol Eclipse 270 MHz [CDCl₃/TMS, δ (p.p.m.), atomic numbering as in Fig. 1]: 2.21 (s, 3H, SCH₃), 3.81 (s, 3H, OCH₃), 6.79 (d, 1H, H22; J: 2.2 Hz), 6.85 (dd, 2H, H24, H26; J: 8.1, 2.2 Hz), 7.30 (t, 1H, H25; 8.1 Hz), 7.43 (dd, 1H, H15; J: 8.4, 1.9 Hz), 7.55 (d, 1H, H13; J: 1.9 Hz), 8.13 (d, 1H, H16; J: 8.4 Hz), 9.97 (brs, 1H, NH).

The elemental analysis was performed on a Perkin Elmer 2400 CHN analyzer; results (%) were within ± 0.4 of predicted values. Calculated for C₁₇H₁₄N₂O₃S₂Cl₂: C, 47.55 H, 3.29 N, 6.52. Found: C, 47.55; H, 3.29; N, 6.52.

The melting point (uncorrected) was measured with a Fischer-Johns micro hot-stage apparatus: 136–138 °C.

S3. Refinement

Hydrogen atoms were placed in calculated positions using a riding atom model with fixed C—H distances [0.86 Å for N, 0.93 Å for C(sp²), 0.96 Å for C(sp³)] and $U_{\text{iso}} = p U_{\text{eq}}$ (parent atom) [$p = 1.2$ for N and C(sp²), 1.5 for C(sp³)].

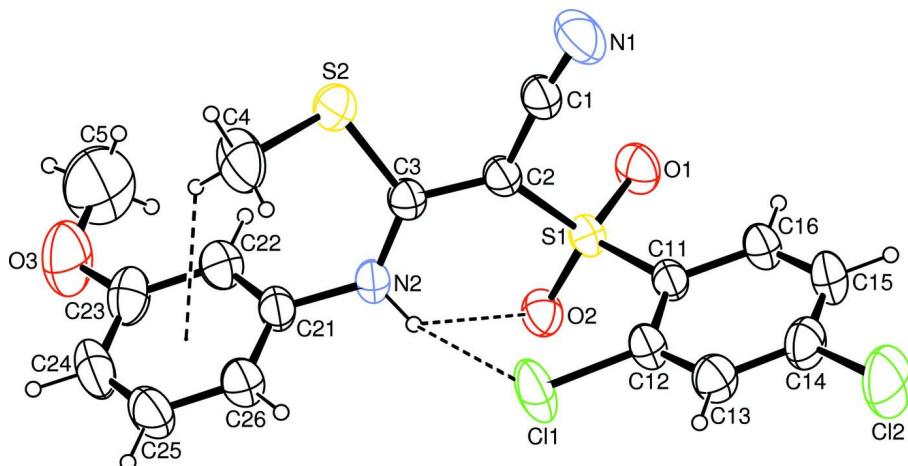

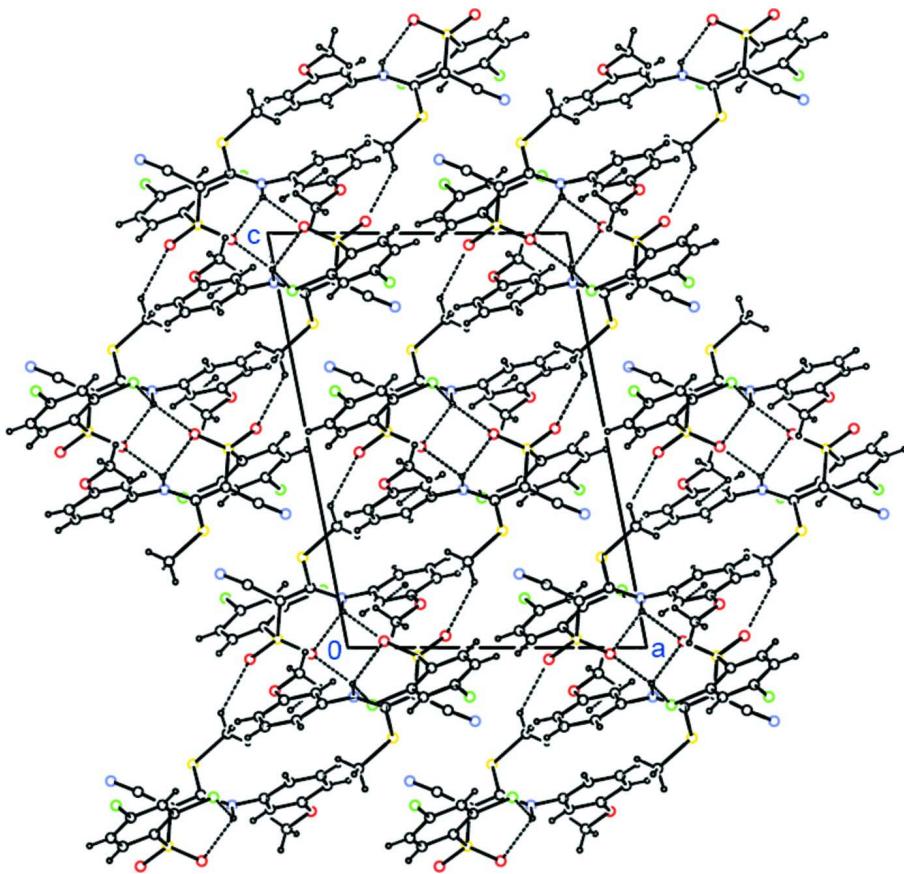

Figure 1

Molecular structure of (I) showing the atomic numbering. Displacement ellipsoids are drawn at 50% probability level. Possible hydrogen bonds are shown as dashed lines.

**Figure 2**

Crystal structure of (I) viewed down the *b* axis. Possible hydrogen bonds are shown as dashed lines.

 $\Delta\rho_{\max} = 0.58 \text{ e } \text{\AA}^{-3}$
 $\Delta\rho_{\min} = -0.27 \text{ e } \text{\AA}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
