

Bis[4-(dimethylamino)pyridinium] dibromidodichlorodimethyl-stannate(IV)

Kong Mun Lo and Seik Weng Ng*

Department of Chemistry, University of Malaya, 50603 Kuala Lumpur, Malaysia
Correspondence e-mail: seikweng@um.edu.my

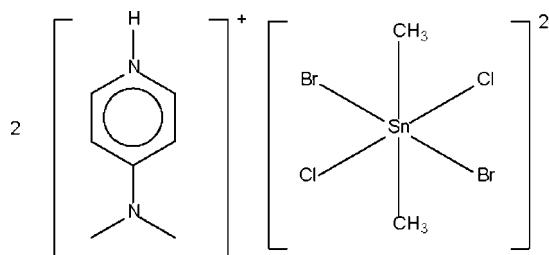

Received 6 May 2008; accepted 7 May 2008

Key indicators: single-crystal X-ray study; $T = 100\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.009\text{ \AA}$; disorder in main residue; R factor = 0.046; wR factor = 0.124; data-to-parameter ratio = 22.6.

The tin(IV) atom in the salt, $(\text{C}_7\text{H}_{11}\text{N}_2)_2[\text{SnBr}_2(\text{CH}_3)_2\text{Cl}_2]$, lies on a center of inversion in a tetragonally compressed octahedron; the bromine atoms are disordered with the chlorine atoms, so that they appear to share the same site. The crystal structure is stabilized by $\text{N}-\text{H}\cdots\text{Br}$ hydrogen bonds.

Bis[4-(dimethylamino)pyridinium] dibromidodichloridodimethylstannate(IV)

Kong Mun Lo and Seik Weng Ng

S1. Comment

Bis(4-methylaminopyridinium) tetrabromidodiphenylstannate is produced from the cleavage of the mixed alkyl/triaryl-stannate, cyclopentyltriphenyltin, by 4-dimethylaminopyridine hydrobromide perbromide (Yap *et al.*, 2008). In principle, the salt can be synthesized from the reaction of 4-dimethylaminopyridine hydrobromide perbromide and diphenyltin dibromide. The possibility is borne out by reacting the organic reagent with dimethyltin dichloride to yield the title salt (Scheme I, Fig. 1). The Sn^{IV} atom of the stannate lies on a center-of-inversion in tetragonally compressed octahedron; the two independent bromine atom share the same site as the two independent chlorine atoms.

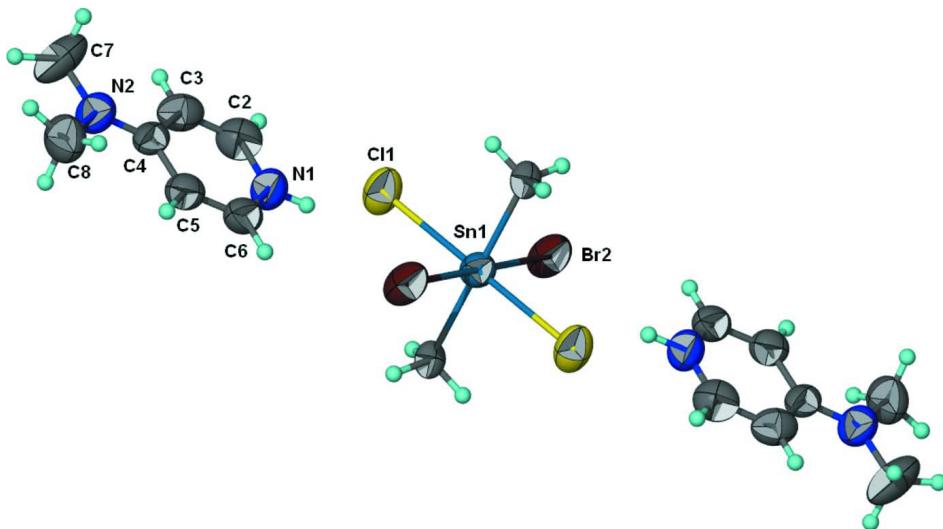

S2. Experimental

Dimethyltin dichloride (2.20 g, 1 mmol) and 4-dimethylaminopyridine hydrobromide perbromide (3.62 g, 1 mmol) were heated in ethanol in an attempt to synthesize the bromodichloridodimethylstannate salt. Colorless crystals separated from it after a few days.

S3. Refinement

Carbon-bound H-atoms were placed in calculated positions (C—H 0.95 to 0.98 Å) and were included in the refinement in the riding model approximation, with $U(H)$ set to 1.2 to 1.5 $U_{\text{eq}}(\text{C})$. The ammonium H atom was similarly treated (N—H 0.88 Å; $U(H) = 1.2 U_{\text{eq}}(\text{N})$).

The chlorine atoms are disordered with respect to the bromine atoms, so that the halogen site is occupied by both a chlorine and a bromine. Constraints were applied so that at each site, the atoms had the same coordinates and the same anisotropic displacement parameters. The occupancies refined to 0.4551 (15) for the Br1/Cl2 pair, and to 0.5449 (15) for the Br2/Cl1 pair. The final difference Fourier map had a large peak at 1 Å from Sn1.

**Figure 1**

Thermal ellipsoid plot (Barbour, 2001) plot of $(C_7H_{11}N)_2[SnBr_2(CH_3)_2Cl_2]$ at the 70% probability level. Hydrogen atoms are drawn as spheres of arbitrary radius. The disorder is not shown.
