Received 26 April 2008; accepted 30 April 2008

Key indicators: single-crystal X-ray study; $T = 100$ K; mean $\sigma(C-C) = 0.002 \text{ \AA}$; R factor = 0.044; wR factor = 0.099; data-to-parameter ratio = 35.6.

In the title compound, $C_{34}H_{34}BrN_5S$, the two phenyl rings of the diphenylaminomethyl group are inclined at an angle of $73.86(8)^\circ$ and they form dihedral angles of $74.04(8)$ and $48.74(8)^\circ$ with the triazole ring. Intramolecular C—H···S hydrogen bonds generate S(6) and S(5) ring motifs. The crystal structure is stabilized by weak C—H··· π interactions.

S1. Comment

Nitrogen-containing heterocyclic molecules constitute the largest portion of chemical entities, which are part of many natural products, fine chemicals, and biologically active pharmaceuticals vital for enhancing the quality of life (Kalluraya *et al.* 2003, 2007; Kane *et al.*, 1990). Mannich bases are a class of heterocycles, which have attracted significant interest in medicinal chemistry (Kalluraya *et al.*, 2004). Among the Mannich bases, 1,2,4-triazole derivatives have attracted considerable attention because of their wide variety of biological activities, such as antineoplastic, analgesic and antibiotic activity (Dave *et al.*, 2007). Mannich bases are obtained by condensing an amine, formaldehyde and a compound containing active hydrogen atom (Kalluraya *et al.*, 2001). It is interesting to note that the reaction is highly regioselective and furnishes only the N-Mannich base and none of the S-Mannich derivatives, though the intermediate Schiff bases can exist in the thiol-thione tautomeric equilibrium. In view of these impressive array of properties exhibited by Mannich bases, the crystal structure of the title compound is reported here.

Bond lengths and angles in the title compound have normal values (Allen *et al.*, 1987). The triazole ring is planar with a maximum deviation of 0.010 (2) Å for atom C1. The planes through the C4—C9, C11—C16, C23—C28 and C29—C34 rings form dihedral angles of 25.10 (8), 81.35 (8), 74.04 (8) and 48.74 (8)°, respectively, with the the triazole ring. Weak C—H···S hydrogen bonds generating S(6) and S(5) ring motifs (Bernstein *et al.*, 1995) are observed in the molecular structure.

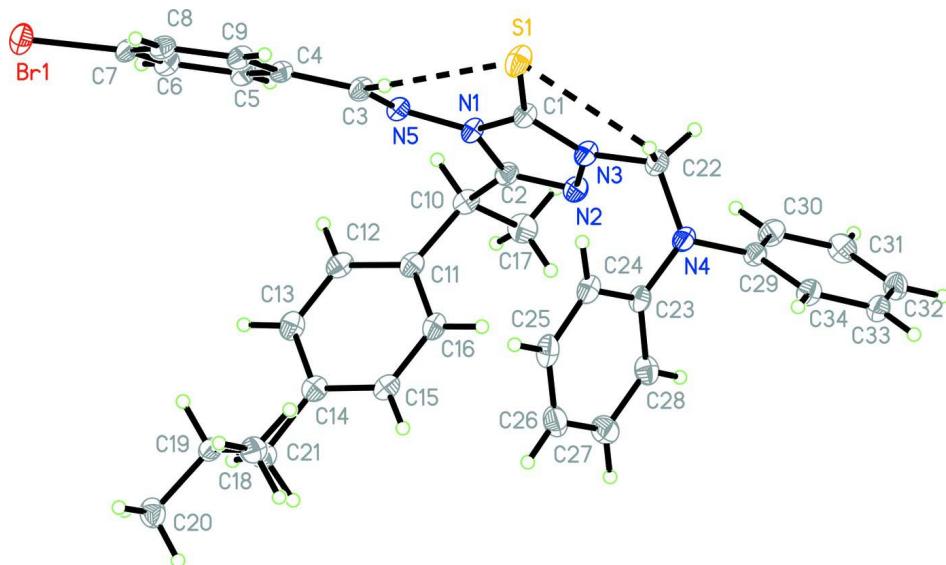

The crystal packing is stabilized by weak C—H···π interactions involving the C11—C16 (centroid *Cg*1) and C23—C28 (centroid *Cg*2) rings (Table 1).

S2. Experimental

The title compound, a Mannich base, was obtained by the aminomethylation of a Schiff base, 4-{[(4-bromophenyl)-methylene]amino}-5-[1-(4-isobutylphenyl)ethyl]-3-mercaptop- 1,2,4-triazole which was in turn obtained by refluxing 4-amino-3-mercpto-5-[1-(4-isobutylphenyl)ethyl]-1,2,4-triazole (0.01 mol) and 4-bromo benzaldehyde (0.01 mol) in ethanol (30 ml) by adding 2 drops of concentrated sulfuric acid for 3 h. A mixture of the obtained Schiff base (0.01 mol), formaldehyde (40%, 1 ml) and diphenyl amine (0.01 mol) in ethanol (50 ml) was stirred at room temperature for 16 h. The solid product was collected by filtration, washed with ethanol and dried. It was then recrystallized from ethanol. Crystals suitable for X-ray analysis were obtained from an acetone-*N,N*-dimethylformamide (DMF) (1:3) solution by slow evaporation (yield 68%; m.p. 381–382 K). Analysis (%) for C₃₄H₃₄N₅BrS found (calculated): C 65.23 (65.38), H 5.33 (5.44), N 11.21 (11.17).

S3. Refinement

H atoms were positioned geometrically [C–H = 0.93–0.98 Å] and refined using a riding model, with $U_{\text{iso}}(\text{H}) = 1.2\text{--}1.5U_{\text{eq}}(\text{C})$. A rotating-group model was used for the methyl groups.

**Figure 1**

*Special details***Experimental.** The data was collected with the Oxford Cyrosystem Cobra low-temperature attachment.**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.**Refinement.** Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.*Fractional atomic coordinates and isotropic or equivalent isotropic displacement parameters (\AA^2)*
