Methyl 4-(trimethylsilylethynyl)benzoate

Storm Potts,* Dinabandhu Das and Martin W. Bredenkamp

Department of Chemistry and Polymer Science, University of Stellenbosch, Private Bag X1, Matieland, 7602, South Africa

Correspondence e-mail: storm@sun.ac.za

Received 1 February 2008; accepted 26 March 2008

Key indicators: single-crystal X-ray study; $T = 100$ K; mean $\sigma(\text{C}-\text{C}) = 0.003$ Å; R factor = 0.059; wR factor = 0.115; data-to-parameter ratio = 20.5.

The title compound, $\text{C}_{13}\text{H}_{16}\text{O}_2\text{Si}$, was synthesized as a precursor for ethynylarene derivatives and crystallized from hexane. In the crystal structure, molecules are linked by weak $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds to form chains that pack in layers in a herringbone fashion.

Methyl 4-(trimethylsilylethynyl)benzoate

S. Potts, D. Das and M. W. Bredenkamp

Comment

The title compound was isolated as a precursor in the synthesis of a series of ethynylarene-based ligands with terminal carboxylate groups. Interest in these kinds of ligands can be attributed to their ability to incorporate metal ions into M—O—C clusters, leading to novel metal-organic frameworks (MOFs), a category of compounds gaining increasing interest due to their potential applications for gas storage and separation and catalysis (Eddaoudi *et al.*, 2001; Dybtsev *et al.*, 2004; Kesanli *et al.*, 2005; Zhao *et al.*, 2004). The structure of the title compound (**I**) is shown in Fig. 1. Molecules of (**I**) pack in layers parallel to the (010) plane forming herring-bone motifs (Fig. 2). Analysis of the crystal packing shows that the molecules are arranged in alternating directions in the layer, due to the bulky trimethylsilyl groups facilitating the close packing of the molecules with the adjacent layer along the *c* axis. The methyl hydrogen atoms of the trimethylsilyl group form C—H \cdots O hydrogen bonds with the carbonyl oxygen atom on the adjacent molecule (Fig. 3).

The acetylenic bond distance [C9—C10 1.200 (3) Å] corresponds with the average value detailed in Allen *et al.* (1987) for C_{sp}≡C_{sp}—C_{sp2} (Ar).

Experimental

The title compound (**I**), was synthesized from trimethylsilylacetylene and 4-iodo(methylbenzoate) using a Sonogashira cross-coupling-type reaction as detailed in (Fasina *et al.*, 2005). Recrystallization from hexane afforded crystals of the title compound.

¹H and ¹³C NMR spectra were recorded as an additional method of characterization, ¹H NMR (CDCl₃, 400 MHz): δ = 0.22 (9H, s, SiCH₃), 3.89 (3H, s, CO₂CH₃), 7.49–7.53 (2H, m, ArH), 7.95–7.99 (2H, m, ArH); ¹³C-NMR (CDCl₃, 75.5 MHz): δ = -0.44 (SiCH₃), 52.063 (OCH₃), 97.738 (CC), 104.16 (CC), 127.952 (ArH), 129.53 (ArH), 129.896 (ArH), 132.029 (ArH), 166.761 (CO)

Refinement

Hydrogen atoms were refined in calculated positions, using a riding model (C—H = 0.98–0.99 Å, *U*_{iso}(H) = 1.5*U*_{eq}(C) for methyl C or 1.2*U*_{eq}(C) or the remaining C atoms).

Figures

Fig. 1. The molecular structure of the title compound showing the atom-labelling scheme. Displacement ellipsoids are shown at the 50% probability level.

Fig. 2. Herring-bone arrangement of the molecules, viewed down the *c* axis.

Fig. 3. C—H...O hydrogen bonds formed between a methyl hydrogen of the trimethylsilyl group and a neighbouring carbonyl oxygen atom. Hydrogen bonds are shown as dashed lines.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
