Received 20 May 2008; accepted 23 May 2008

Key indicators: single-crystal X-ray study;  $T = 223\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$ ;  $R$  factor = 0.047;  $wR$  factor = 0.138; data-to-parameter ratio = 21.0.

In the title molecule,  $\text{C}_{15}\text{H}_{12}\text{O}_3$ , the two six-membered and one five-membered fused-ring system is almost planar and the  $\text{CH}_2\text{C}(=\text{O})\text{OH}$  residue is essentially orthogonal to it. In the crystal structure, centrosymmetric dimers are formed via the carboxylic acid  $\{\cdots\text{O}=\text{C}-\text{O}-\text{H}\}_2$  synthon.

## 2-(2-Methylnaphtho[2,1-*b*]furan-1-yl)acetic acid

Martyn Jevric, Dennis K. Taylor and Edward R. T. Tiekink

### S1. Comment

The effective dehydrogenation of diastereomeric mixture of 1, Fig. 3, to form the aromatized tricyclic 2 could be effected with the use of DDQ in THF under reflux conditions (Haselgrove *et al.*, 1999). Crystals of the title acid derivative (I) were obtained by base hydrolysis of 2 in methanol solution (Jevric *et al.*, 2001).

The tricyclic system in (I), Fig. 1, comprises six- (A), six- (B), and five-membered rings (C) with the sequence of dihedral angles between their respective least-squares planes being 1.48 (6), 2.34 (6), 0.91 (6) ° for A/B, A/C, and B/C, respectively. The  $\text{CH}_2\text{C}(=\text{O})\text{OH}$  residue is essentially orthogonal to this aromatic system as seen in the C1/C11/C12/O11 torsion angle of -165.68 (9)°. Centrosymmetrically related molecules associate into dimers *via* the familiar eight-membered carboxylic acid  $\{\cdots\text{O}=\text{C}—\text{O}—\text{H}\}_2$  synthon, Table 1. Each dimer thus formed is associated to two other molecules, each related by 2-fold symmetry, *via* C—H···O contacts. These consolidate molecules into a 2-D array in the *bc*-plane as shown in Fig. 2.

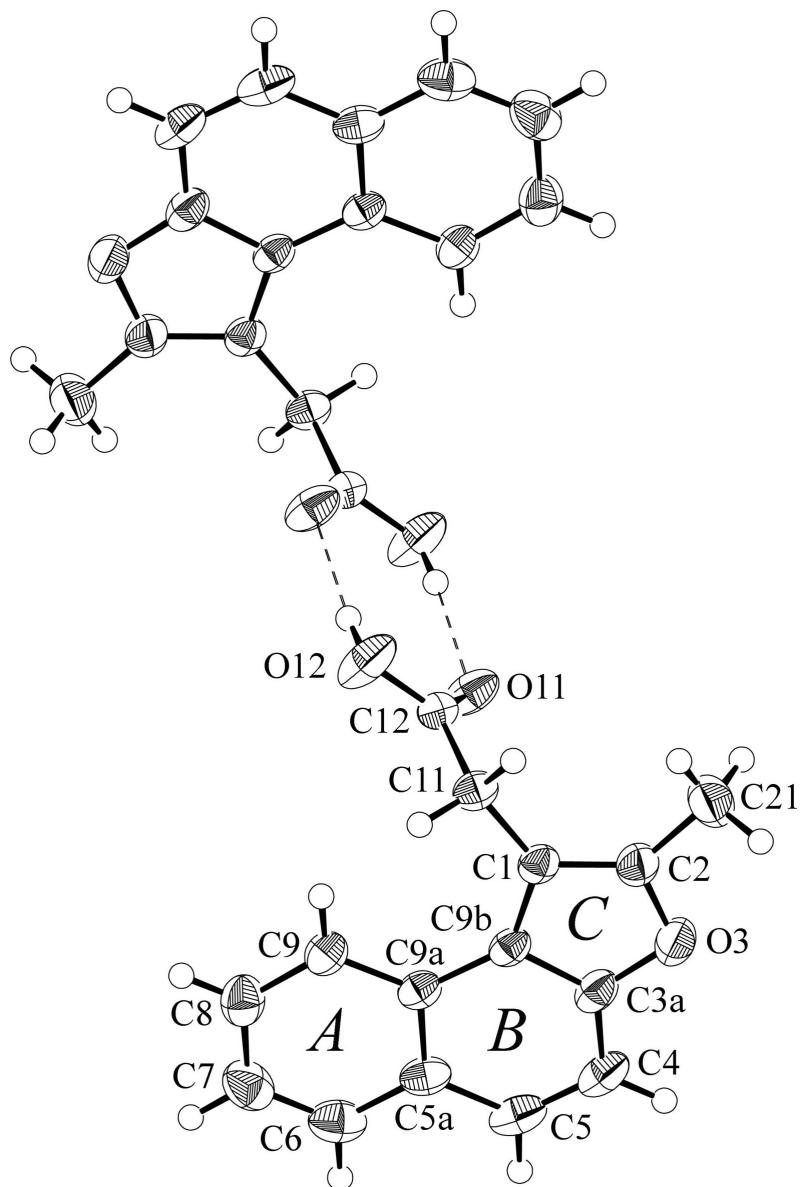

### S2. Experimental

To a stirring solution of 1 (Fig. 3, 1.91 g, 7.46 mmol) in anhydrous THF (50 ml) was added DDQ (1.81 g, 7.97 mmol) and the reaction brought to reflux for 24 h under a nitrogen atmosphere. The solution was allowed to cool to room temperature, diluted with water and extracted twice with dichloromethane. The organic phase was dried ( $\text{MgSO}_4$ ), filtered and volatiles removed in vacuo. The crude residue was purified by column chromatography (10% acetone in hexane) to give pure methyl 2-(2-methylnaphtho[2,1-*b*]furan-1-yl)acetate, 2, as a yellow solid, m.p.: 349–351 K.  $R_f$  0.41 (10% acetone in hexane). IR ( $\text{CH}_2\text{Cl}_2$ ,  $\text{cm}^{-1}$ ) 1738, 1620, 1581, 1525, 804.  $^1\text{H}$  NMR ( $\text{CDCl}_3$ , 300 MHz)  $\delta$  2.25 (s, 3H), 3.70 (s, 3H), 3.98 (s, 2H), 7.45–7.48 (m, 1H), 7.56–7.60 (m, 2H), 7.65–7.68 (m, 1H), 7.92–7.94 (m, 1H), 8.23–8.26 (m, 1H) p.p.m..  $^{13}\text{C}$  NMR ( $\text{CDCl}_3$ , 50 MHz)  $\delta$  12.0, 31.5, 52.2, 109.5, 112.1, 122.2, 122.8, 124.0, 124.6, 126.1, 128.0, 129.0, 130.8, 151.5, 152.2, 171.6 p.p.m.. MS  $m/z$  (%): 254 ( $M^+$ , 76), 95 (100), 181 (31), 165 (27), 152 (22). HRMS,  $\text{C}_{16}\text{H}_{14}\text{O}_3$ : calcd, 254.0943. Found 254.0942.

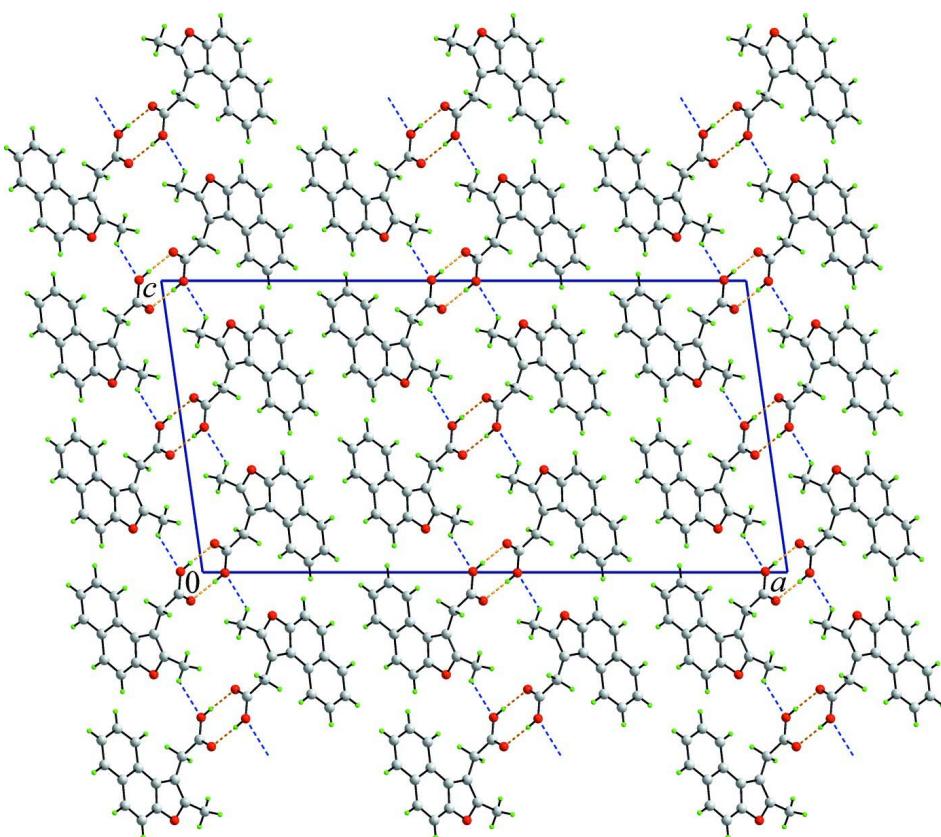

Compound (I) was obtained by the base hydrolysis of 2 in methanol solution. The colourless solid was recrystallized from ethanol solution in 75% yield; m.p.: 451–455 K (decomposes, sealed tube). IR (nujol,  $\text{cm}^{-1}$ ) 1699, 1622, 1579, 1525.  $^1\text{H}$  NMR ( $\text{CDCl}_3$ , 300 MHz)  $\delta$  2.51 (s, 3H), 4.00 (s, 2H), 7.44–7.69 (m, 4H), 7.91–7.94 (m, 1H), 8.21–8.23 (m, 1H) p.p.m..  $^{13}\text{C}$  NMR ( $\text{CDCl}_3$ , 50 MHz)  $\delta$  11.9, 31.1, 108.8, 112.1, 122.0, 122.7, 124.0, 126.2, 127.9, 129.1, 130.8, 151.6, 152.4, 175.5 (1 masked carbon) p.p.m.. MS  $m/z$  (%): 240 ( $M^+$ , 39), 195 (100), 165 (13), 152 (13), 69 (37). Elemental analysis found: C, 74.92; H, 4.98%.  $\text{C}_{15}\text{H}_{12}\text{O}_3$  requires C, 74.99; H, 5.03%.

### S3. Refinement

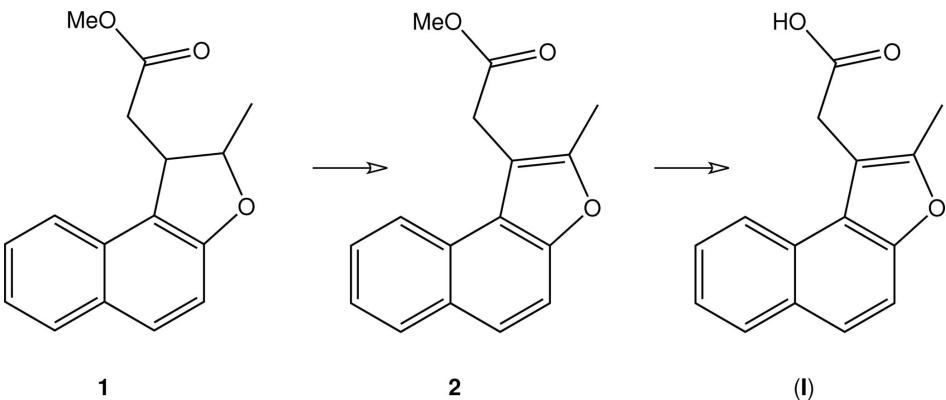

All H atoms were included in the riding-model approximation, with C—H = 0.94 to 0.98 Å and O—H = 0.83 Å, and with  $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}$ (methyl-C and O) or  $1.2U_{\text{eq}}$ (remaining C).

**Figure 1**

Molecular structure of (I) showing atom-labelling scheme and displacement ellipsoids at the 50% probability level. In addition an unlabelled symmetry related ( $1-x, 1-y, 1-z$ ) molecule is shown to demonstrate the formation of a hydrogen bonded dimer.

**Figure 2**

Crystal packing in (I) viewed in projection down the  $b$  axis highlighting the stacking of the 2-D arrays. Colour scheme red (O), grey (C), and green (H). The  $O—H\cdots O$  (orange) and  $C—H\cdots O$  (blue) contacts are shown as dashed lines.

**Figure 3**

Reaction scheme.

 $\Delta\rho_{\text{max}} = 0.34$  e Å<sup>-3</sup>  
 $\Delta\rho_{\text{min}} = -0.15$  e Å<sup>-3</sup>

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
