Received 12 May 2008; accepted 25 May 2008

Key indicators: single-crystal X-ray study; $T = 298$ K; mean $\sigma(C-C) = 0.007$ Å; disorder in main residue; R factor = 0.068; wR factor = 0.159; data-to-parameter ratio = 15.1.

The asymmetric unit of the title compound, $C_{30}H_{27}N_2O_4PS_2$, consists of two crystallographically independent molecules. The thieno[2,3-*b*]thiophene ring systems are planar. One of the terminal ethyl groups is disordered over two positions; the site occupancy factors are *ca* 0.7 and 0.3. The crystal structure is stabilized by N–H···N, N–H···O and C–H···O hydrogen bonds.

Related literature

Related preparation and biological activity are described by Walter (1999a,b). For related literature, see: Ding *et al.* (2004). For the crystal structure of another fused pyrimidinone derivative, see: Liu & Hu (2006). For related literature, see: Liao *et al.* (2007).

Diethyl 3-amino-4-[(triphenylphosphoranylidene)amino]thieno[2,3-*b*]thiophene-2,5-dicarboxylate

Xiang Wang, Yan Li and Ming-Guo Liu

S1. Comment

The derivatives of heterocycles containing the thienopyrimidine system, which are well known bioisosteres of quinazolines, are of great importance because of their remarkable biological properties (Walter, 1999a,b; Ding *et al.*, 2004). As a part of our ongoing investigations on the preparation of derivatives of heterocyclic compounds (Liu & Hu, 2006; Liao *et al.*, 2007), we have synthesized and structurally characterized the title compound. In the crystal structure of the title compound two crystallographically independent molecules are found in the asymmetric unit. All ring atoms of the thieno[2,3-*b*]thiophene ring systems lie in a common plane, with maximum deviations of 0.01 (1) Å and 0.02 (1) Å. The crystal structure is stabilized by N—H···N, N—H···O and C—H···O hydrogen bonds (Table 1).

S2. Refinement

One of the terminal ethyl groups is disordered over two sites with site occupation factors of 0.66 (2) and 0.34 (2). The following restraints have been applied for the disordered atoms: O—CH₂ 1.45 (1) Å, CH₂—CH₃ 1.54 (1) Å and O···CH₃ 2.45 (1) Å. All H-atoms were positioned with idealized geometry and refined with fixed isotropic U values ($U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C})$ for methyl H atoms and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ for all other H atoms) using a riding model with C—H = 0.93 Å, 0.97 Å = 0.96 Å and N—H = 0.86 Å.

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
