Received 30 June 2008; accepted 26 July 2008

Key indicators: single-crystal X-ray study;  $T = 291$  K; mean  $\sigma(\text{C}-\text{C}) = 0.004$  Å; disorder in solvent or counterion;  $R$  factor = 0.033;  $wR$  factor = 0.091; data-to-parameter ratio = 13.5.

The title complex,  $[\text{Cu}_2(\text{C}_7\text{H}_6\text{NO}_2)_2(\text{C}_{12}\text{H}_8\text{N}_2)_2(\text{H}_2\text{O})_2] \cdot 2\text{C}_7\text{H}_7\text{NO}_2 \cdot 2\text{H}_2\text{O}$ , consists of a dinuclear  $[\text{Cu}_2(\text{C}_7\text{H}_6\text{NO}_2)_2(\text{C}_{12}\text{H}_8\text{N}_2)_2(\text{H}_2\text{O})_2]^{2+}$  cation, two  $\text{Cl}^-$  anions, two 4-aminobenzoic acid molecules and two disordered water molecules (site occupancy factors 0.5). The Cu(II) ion adopts a distorted square-pyramidal geometry formed by two N atoms from the 1,10-phenanthroline ligand and two O atoms of the two 4-aminobenzoic acid ligands and one water O atom. The  $\text{Cu} \cdots \text{Cu}$  separation is 3.109 (2) Å. A twofold axis passes through the mid-point of the  $\text{Cu} \cdots \text{Cu}$  vector.

## A dinuclear copper complex: bis( $\mu$ -4-aminobenzoato)bis[aqua(1,10-phenanthroline)copper(II)] dichloride bis(4-aminobenzoic acid) dihydrate

Miao-Ling Huang, Qing-Fan Xie, Jing-Chun Xian, Yan-Min Chen and Zi-Qiao Zhou

### S1. Comment

During the last three decades, copper complexes have received much attention because of their interesting interactions with biological ligands to generate stable mixed coordinated complexes, which play a key role in life processes such as enzymatic catalysis, storage and conveyance of the matter, transfer of copper ions (Müller, *et al.*, 2003; Rao, *et al.*, 2004; Lo, *et al.*, 2000). 4-Aminobenzoic acid, an important part of folic acid, is a constituent of the vitamin B complex and is found in animal and plant tissues, and has been shown to be a growth factor in certain microorganisms, particularly Enterococci and Lactobacilli (Zoroddu *et al.*, 1996). In order to extend further the study of 4-aminobenzoic acid ligand coordinated to copper ion, we have synthesized the title complex, (I) and determined its crystal structure by X-ray diffraction which is presented in this article.

The molecular structure and crystal packing diagram of the title compound are presented in Figs. 1 and 2, respectively. The structure is composed of a dimeric  $[\text{Cu}_2(\text{C}_7\text{H}_6\text{NO}_2)_2(\text{C}_{12}\text{H}_8\text{N}_2)_2(\text{H}_2\text{O})]_2^+$  cation with two five-coordinated Cu(II) ions linked by two oxygen atoms of 4-aminobenzoic acid, two Cl<sup>-</sup> anions, two 4-aminobenzoic acid molecules and two disordered water molecules lying over four sites with 0.5 occupancy factors each. The Cu(II) ion has a distorted square-pyramidal geometry with two N atoms of 1,10-phenanthroline ligand and two O atoms of two 4-aminobenzoic acid ligands occupying basal sites and the apical position being occupied by an O atom of H<sub>2</sub>O. The benzoic acid molecules not coordinated to Cu are hydrogen bonded to Cl<sup>-</sup> ions by amino H-atoms and to water of coordination by hydroxyl H-atoms (details are given in Table 1). As a matter of fact, the complex molecules, Cl<sup>-</sup> anions, 4-aminobenzoic acid molecules and water molecules are linked by a network of O—H···O, N—H···O and O—H···Cl hydrogen bonds into a three-dimensional supramolecular structure. In the complex, the two 1,10-phenanthroline ligands are stacked with their centroids separated by 3.661 (2) Å indicating significant  $\pi$ – $\pi$  interactions.

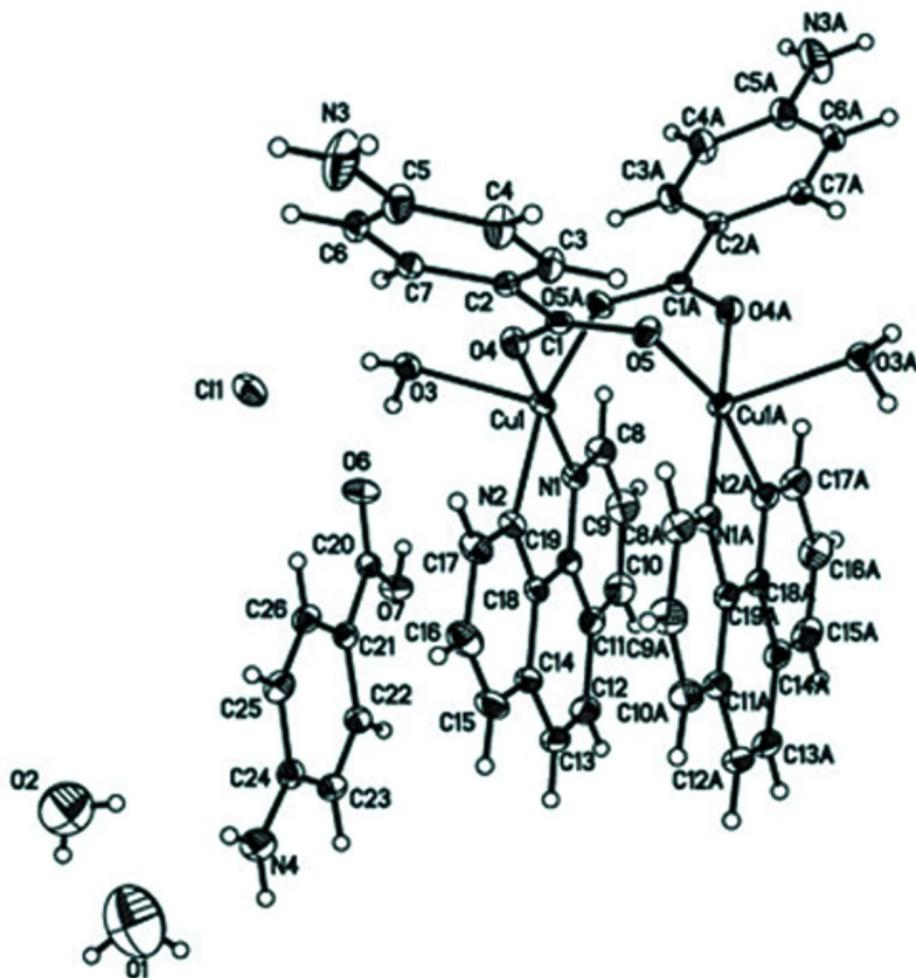

### S2. Experimental

An aqueous solution (5 ml) of CuCl<sub>2</sub>.3H<sub>2</sub>O (1 mmol) was added slowly to a mixed solution of 4-aminobenzoic acid (1.5 mmol) in H<sub>2</sub>O (5 ml) and 1,10-phenanthroline (1 mmol) in ethanol (95%, 5 ml). After refluxing for 3 h, the mixture was filtered off while hot. The dark-green single crystals suitable for X-ray analysis were obtained by slow evaporation of the above filtrate at room temperature after a week.

### S3. Refinement

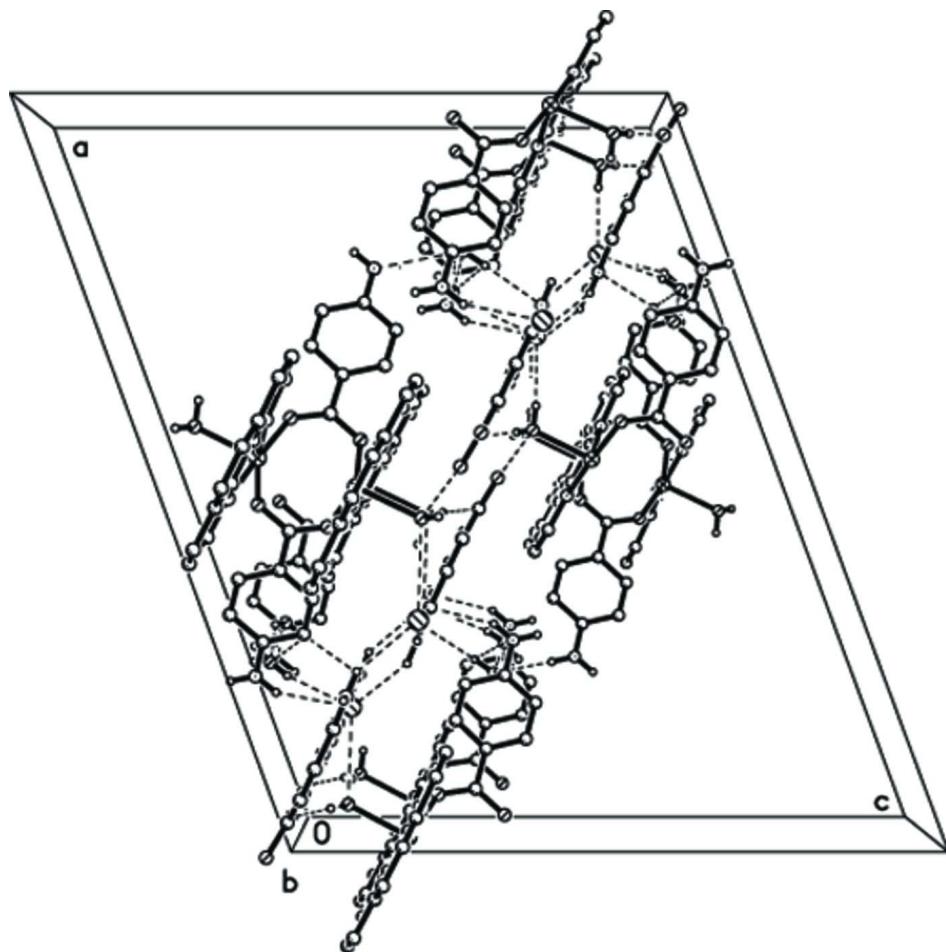

The occupancy factors of water molecules not involved in coordination refined close to 0.5 values at the initial stages. Hence, site occupancy factors for both water molecules were fixed at 0.5. H-atoms bonded to water molecules were taken from a difference Fourier map and were fixed at those positions during the refinements with  $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{O})$ . H atoms bonded to C, N and hydroxyl O atoms were placed geometrically and treated as riding, with distances C—H = 0.93, N—

H = 0.86 and O—H = 0.82 Å and  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C and N})$  and  $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{O})$ .

#### Refinement

Refinement on  $F^2$   
Least-squares matrix: full  
 $R[F^2 > 2\sigma(F^2)] = 0.032$   
 $wR(F^2) = 0.091$   
 $S = 1.02$   
4744 reflections  
352 parameters  
0 restraints  
Primary atom site location: structure-invariant direct methods

Secondary atom site location: difference Fourier map  
Hydrogen site location: inferred from neighbouring sites  
H-atom parameters constrained  
 $w = 1/[\sigma^2(F_o^2) + (0.0477P)^2 + 4.1583P]$   
where  $P = (F_o^2 + 2F_c^2)/3$   
 $(\Delta/\sigma)_{\text{max}} < 0.001$   
 $\Delta\rho_{\text{max}} = 0.49 \text{ e } \text{\AA}^{-3}$   
 $\Delta\rho_{\text{min}} = -0.31 \text{ e } \text{\AA}^{-3}$

#### Special details

**Experimental.** Yield 81%. IR(KBr): 3409(s), 3190(w), 3057(w), 2921(m), 2857(w), 1734(w), 1671(s), 1630(s), 1600(*versus*), 1550(s), 1516(s), 1494(w), 1418(m), 1389(*versus*), 1344(w), 1312(m), 1267(s), 1222(vw), 1178(s), 1146(m), 1108(m), 1046(w), 854(s), 844(s), 786(m), 719(s), 702(w), 643(m), 609(m), 511(m), 466(w), 430(w).

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
