Key indicators: single-crystal X-ray study; T = 292 K; mean σ(C–C) = 0.006 Å; R factor = 0.048; wR factor = 0.148; data-to-parameter ratio = 13.2.

In the title compound, $[Zn(C_6H_2N_2O_4)(C_{18}H_{10}N_4)(H_2O)]_n$ or $[Zn(PZDC)(DPPZ)(H_2O)]_n$ (where DPPZ is dipyrido[3,2-*a*:2′,3′-*c*]phenazine and H_2PZDC is pyrazine-2,3-dicarboxylic acid), the Zn atom is six-coordinated in a slightly distorted octahedral coordination geometry by three N atoms from one DPPZ ligand and one $PZDC^{2-}$ dianion, three O atoms from two different $PZDC^{2-}$ ligands and one water molecule. Each $PZDC^{2-}$ dianion serves as a spacer, connecting adjacent metal atoms into a polymeric chain structure parallel to the *b* axis. The chain motif is consolidated into a three-dimensional supramolecular network by O—H···O and O—H···N hydrogen bonds and π–π aromatic stacking interactions involving adjacent DPPZ ligands and $PZDC^{2-}$ dianions with centroid–centroid separations of 3.522 (6) and 3.732 (8) Å, respectively.

S1. Comment

A successful strategy for preparing metal-organic supramolecular architectures is the assembly reaction between a transition d^{10} metal ion and two types of ligands with one acting as a bridging ligand and the other as a chelating ligand (Liu *et al.*, 2008; Che *et al.*, 2008). Pyrazine-2,3-dicarboxylic acid (H_2PZDC) possesses the ability to bridge and chelate metal atoms using the carboxylate oxygen atoms and nitrogen atoms (Xu *et al.*, 2008). 1,10-Phenanthroline (phen) and its derivatives are important chelating ligands for the construction of metal-organic complexes (Che, Xu & Liu, 2006). Dipyrido[3,2-a:2′,3′-c]-phenazine (DPPZ) as a phen derivative possesses potential supramolecular recognition sites for π-π aromatic stacking interactions. The present attempt at synthesizing a new zinc polymer with DPPZ and H_2PZDC gave the title complex, $[Zn(DPPZ)(PZDC)(H_2O)]_n$, whose structure is reported here.

The Zn atom is six-coordinated by three N atoms from one DPPZ ligand and one $PZDC^{2-}$ ligand, and three O atoms from two different $PZDC^{2-}$ ligands and one water molecule in a slightly distorted octahedral coordination geometry (Fig. 1). The Zn—O distances range from 2.051 (3) Å to 2.172 (3) Å and the Zn—N lengths from 2.130 (3) Å to 2.167 (3) Å (Table 1). Each $PZDC^{2-}$ dianion serves as a spacer to connect adjacent metal centres into a one-dimensional chain structure parallel to the *b* axis. Neighbouring chains interact through π-π contacts, leading to a three-dimensional supramolecular structure (Fig. 2). There are two types of π-π interactions, occurring between adjacent DPPZ ligands (centroid-to-centroid separation = 3.732 (8) Å) and $PZDC^{2-}$ anions (centroid-to-centroid separation = 3.522 (6) Å). Hydrogen bonds involving the O1W atom as donor and the N6 and O3 atoms of the $PZDC^{2-}$ dianion as acceptors further stabilize the structure (Table 2).

S2. Experimental

The DPPZ ligand was synthesized according to the literature method (Che, Li *et al.*, 2006). The title compound was hydrothermally synthesized under autogenous pressure: a mixture of DPPZ, H_2PZDC, $ZnNO_3$ and water in a molar ratio of 1:1:1:5000 was sealed in a Teflon-lined autoclave and heated to 433 K for 3 d. Upon cooling and opening the bomb, yellow blocks of the title compound were obtained (83% yield based on Zn).

S3. Refinement

All H atoms on C atoms were positioned geometrically (C—H = 0.93 Å) and refined as riding, with $U_{iso}(H)= 1.2U_{eq}(C)$. The hydrogen atoms of water molecule were located from a difference Fourier map and refined freely.

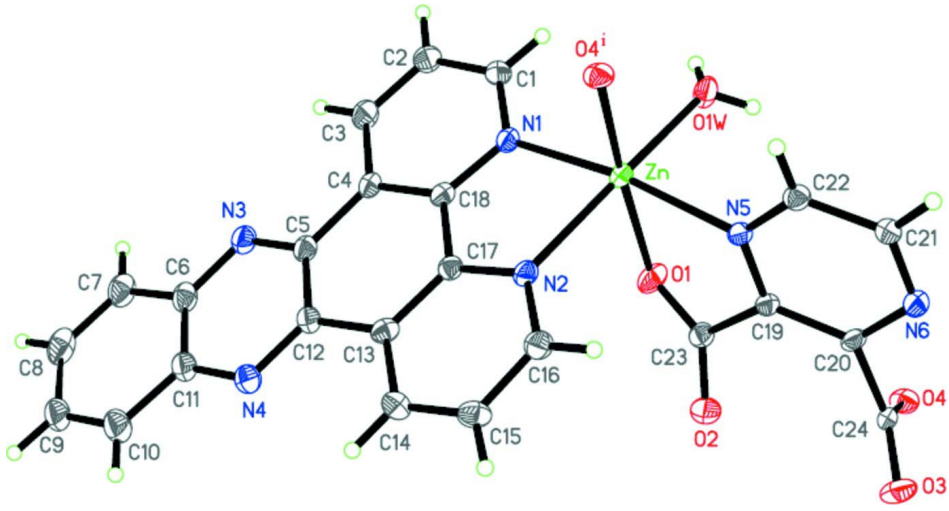

Figure 1

A view of the title compound. Displacement ellipsoids are drawn at the 30% probability level (arbitrary spheres for the H atoms). [Symmetry code: (i) x, $y+1$, z.]

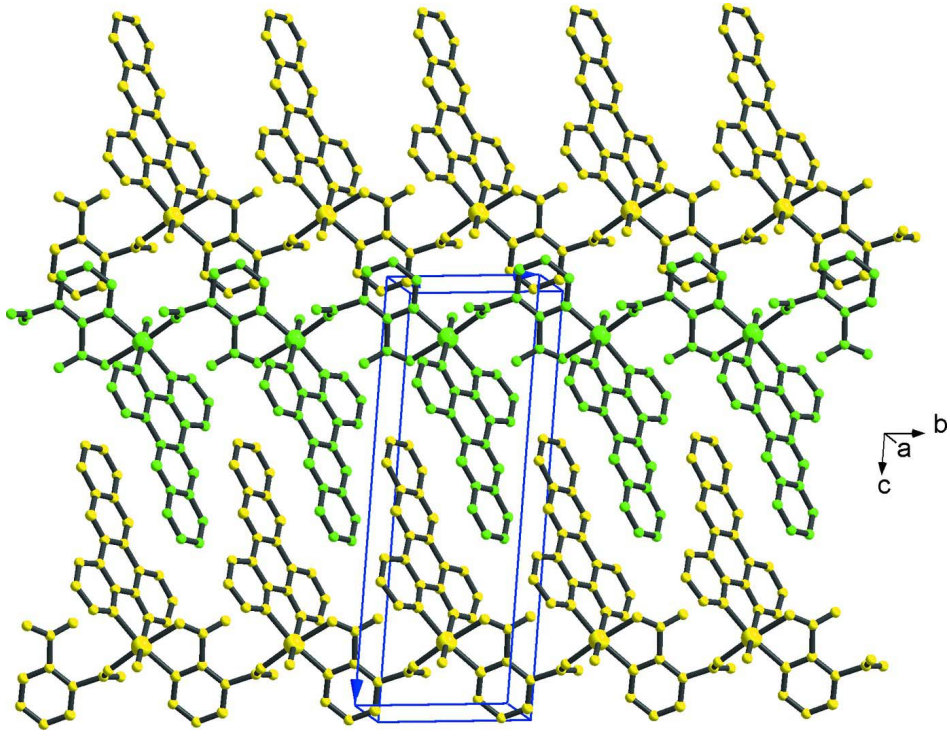

Figure 2

Packing diagram of the three-dimensional supramolecular structure of the title compound formed *via* π-π interactions. H atoms are omitted for clarity.

$\Delta\rho_{max} = 0.42$ e Å^{-3}
$\Delta\rho_{min} = -0.58$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2, conventional R-factors R are based on F, with F set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.
