Received 4 July 2008; accepted 19 August 2008

Key indicators: single-crystal X-ray study;  $T = 298$  K; mean  $\sigma(C-C) = 0.014$  Å;  $R$  factor = 0.046;  $wR$  factor = 0.084; data-to-parameter ratio = 14.8.

The title compound,  $[Pd(C_{18}H_{14}PS)_2]$ , was synthesized by the reaction of  $(Ph_2PC_6H_4SH)$  with  $[PdCl_2(NCC_6H_5)_2]$  in a 2:1 molar ratio in the presence of a slight excess of  $NEt_3$  as base in dichloromethane. The compound crystallizes with the Pd(II) atom on a twofold rotation axis. The palladium center has a slightly distorted square-planar environment, with the two  $P-S$  chelating ligands adopting a *cis* configuration. The present structure is a pseudo-polymorph of  $[Pd(C_{18}H_{14}PS)_2] \cdot CH_2Cl_2$ .

## **cis-Bis[2-(diphenylphosphino)benzenethiolato- $\kappa^2P,S$ ]palladium(II)**

**Jaime Fierro-Arias, David Morales-Morales and Simón Hernández-Ortega**

### S1. Comment

In recent years, attention has increasingly been paid to the coordination chemistry of polydentate ligands incorporating both thiolate and tertiary phosphine donor ligands, as their combination is likely to confer unusual structures and reactivities on their metal complexes (Dilworth, *et al.*, 2000; Morales-Morales *et al.*, 2002*a*; Gómez-Benítez *et al.*, 2003). These complexes have shown an intriguing variety of structures (Andreasen *et al.* 1999; Taguchi *et al.*, 1999) or unusual oxidation states and enhanced solubility (Ortner *et al.*, 2000), making these species excellent candidates for further studies in reactivity. Moreover, the presence of these ligands in the coordination sphere of transition metal complexes may render interesting behaviours in solution as these ligands can be capable of full or partial de-ligation (hemilability) (Dilworth & Weatley, 2000; Braunstein & Naud, 2001) being able to provide important extra coordination sites for incoming substrates during a catalytic process (Dilworth & Weatley, 2000, Braunstein & Naud, 2001). Thus, given our continuous interest in the synthesis of transition metal complexes bearing P—S hybrid ligands (Morales-Morales *et al.*, 2002*a*, 2002*b*; Gómez-Benítez *et al.*, 2007*a*, 2007*b*; Ríos-Moreno *et al.*, 2005; Canseco-Gonzalez *et al.*, 2003, 2004) we report the crystal structure of a pseudo-polymorph of the Pd(II) complex *cis*-[Pd(Ph<sub>2</sub>PC<sub>6</sub>H<sub>4</sub>-2-S)<sub>2</sub>] (Real *et al.*, 2000; Canseco-Gonzalez *et al.*, 2003)

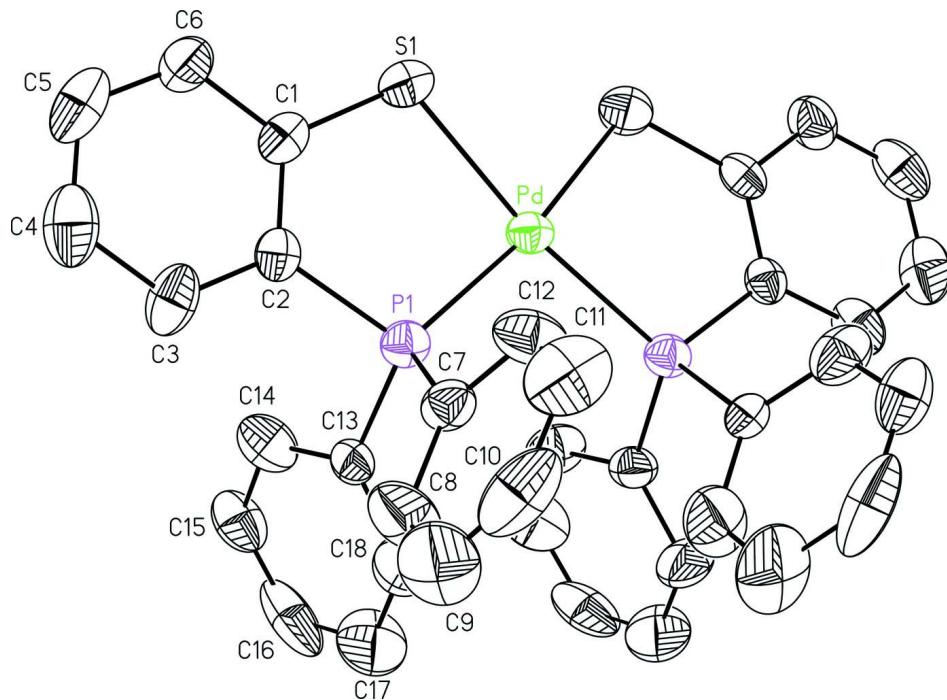

The asymmetric unit contains only half of molecule, with the Pd atom in special position of site symmetry 2. The structure of the title compound is shown with the numbering scheme in Fig. 1. The geometric parameters do not differ significantly from the values reported in the previously described polymorphs. The complex exhibits the Pd center into a slightly distorted square planar environment with the two P—S chelating ligands adopting a *cis* conformation.

### S2. Experimental

Synthesis of *cis*-[Pd(Ph<sub>2</sub>PC<sub>6</sub>H<sub>4</sub>-2-S)<sub>2</sub>] (I). To a solution of (Ph<sub>2</sub>PC<sub>6</sub>H<sub>4</sub>-2-SH) (34 mg, 0.12 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (20 ml), NEt<sub>3</sub> (13 mg, 0.13 mmol) and a CH<sub>2</sub>Cl<sub>2</sub> solution (30 ml) of [Pd(Cl)<sub>2</sub>(NCC<sub>6</sub>H<sub>5</sub>)<sub>2</sub>] (22 mg, 0.058 mmol) were added under stirring. The resulting mixture was allowed to stir overnight. After this time, formation of a pale yellow precipitated was noticed, the product was filtered off under vacuum and washed twice with methanol. Recrystallization from a double layer solvent system CH<sub>2</sub>Cl<sub>2</sub>/MeOH afforded complex I as a microcrystalline yellow powder. Yield 87.5%. <sup>1</sup>H-NMR (300 MHz, CDCl<sub>3</sub>), (7.71–6.79 (m, Ph, 28H); <sup>31</sup>P-NMR (121 MHz, CDCl<sub>3</sub>), (-42.42 (*s*). Elem. Anal. Calculated for [C<sub>36</sub>H<sub>28</sub>P<sub>2</sub>S<sub>2</sub>Pd] Calc. %: C: 64.20, H: 4.00. Found %: C: 64.00, H: 4.20. MS-FAB<sup>+</sup> [M<sup>+</sup>] = 692 m/z.

### S3. Refinement

H atoms were included in calculated positions (C—H = 0.93 Å), and refined using a riding model, with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}$  of the carrier atom. Geometrical restraints were applied in phenyl rings on P atom.

**Figure 1**

Molecular structure of the title compound with the atoms numbering scheme. Displacement ellipsoids are shown at the 40% probability level. All H atoms have been omitted for clarity. The symmetry operator for generating equivalent atoms symmetry operator;  $y, x, -z$ .

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
