# $(\mu$ -Piperazine-1,4-dicarbodithioato- $\kappa^4 S, S', S'', S''')$ bis[triphenyltin(IV)] dichloromethane solvate

Pavel Poplaukhin and Edward R. T. Tiekink\*

Department of Chemistry, University of Texas at San Antonio, One UTSA Circle, San Antonio, TX 78249-0698, USA

Correspondence e-mail: edward.tiekink@utsa.edu

Received 1 August 2008; accepted 11 August 2008

 Key indicators: single-crystal X-ray study;  $T = 98$  K; mean  $\sigma(C-C) = 0.007$  Å; disorder in solvent or counterion;  $R$  factor = 0.049;  $wR$  factor = 0.113; data-to-parameter ratio = 18.0.

The dinuclear centrosymmetric title compound,  $[Sn_2(C_6H_5)_6(C_6H_8N_2S_4)] \cdot CH_2Cl_2$ , features a distorted *cis*-trigonal-bipyramidal coordination geometry for Sn based on a  $C_3S_2$  donor set. The dinuclear molecule lies across a centre of inversion. The solvent dichloromethane molecule is disordered about a centre of inversion.

**( $\mu$ -Piperazine-1,4-dicarbodithioato- $\kappa^4 S, S', S'', S'''$ )bis[triphenyltin(IV)] dichloromethane solvate**

**P. Poplaukhin and E. R. Tiekink**

**Comment**

Tin dithiocarbamates continue to attract interest owing to their variety of applications (Tiekink, 2008). The title compound,  $\text{Ph}_3\text{SnS}_2\text{CN}(\text{CH}_2\text{CH}_2)_2\text{NCS}_2\text{SnPh}_3$ , has been reported previously as a methanol solvate (Yin *et al.*, 2002). The present structure (I) has been isolated as a dichloromethane solvate, Fig. 1. The molecule is centrosymmetric so that the  $\text{Ph}_3\text{Sn}$  entities lie to either side of the pyrrolidine ring which adopts a chair conformation. The dithiocarbamate ligand coordinates in an asymmetric mode, forming Sn—S1 and Sn—S2 distances of 2.4699 (13) and 3.0715 (13) Å, respectively. The coordination geometry is based on a distorted trigonal bipyramid as indicated by the value of  $\tau = 0.64$  (Addison *et al.*, 1984).

**Experimental**

The title compound was prepared by following a literature procedure (Yin *et al.*, 2002). Colourless crystals were isolated by the slow evaporation of a dichloromethane solution of (I); m.p. 487–489 K (crystal turned opaque at 363–368 K). TGA: two steps, First mass loss 7.2% (onset 388.3 K, midpoint 392.6 K, endset 396.9 K) corresponds to loss  $\text{CH}_2\text{Cl}_2$  (8.2% theoretical). Second mass loss 69.3% (onset 558.5 K, midpoint 620 K, endset 680 K), corresponds to decomposition to SnS (total experimental mass loss 76.5% cf. theoretical value 70.5%). IR ( $\text{cm}^{-1}$ ): 1427, 1416 (strong, C=N), 1214 (strong, C—S).

**Refinement**

The H atoms were geometrically placed (C—H = 0.95–0.99 Å) and refined as riding with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ . The solvent dichloromethane molecule was disordered about a centre of inversion and was modelled with anisotropic displacement parameters.

**Figures**

Fig. 1. Molecular structure of (I) showing the crystallographic numbering scheme. Displacement ellipsoids are shown at the 70% probability level. Unlabelled atoms are related by the symmetry operation  $i: -x, 1-y, 1-z$ . The disordered dichloromethane molecule is omitted.

### Crystal data

$[\text{Sn}_2(\text{C}_6\text{H}_5)_6(\text{C}_6\text{H}_8\text{N}_2\text{S}_4)] \cdot \text{CH}_2\text{Cl}_2$	$F_{000} = 1020$
$M_r = 1021.37$	$D_x = 1.594 \text{ Mg m}^{-3}$
Monoclinic, $P2_1/c$	Mo $K\alpha$ radiation
Hall symbol: -P 2ybc	$\lambda = 0.71069 \text{ \AA}$
$a = 14.681 (5) \text{ \AA}$	Cell parameters from 13756 reflections
$b = 10.758 (3) \text{ \AA}$	$\theta = 2.4\text{--}40.7^\circ$
$c = 13.470 (4) \text{ \AA}$	$\mu = 1.53 \text{ mm}^{-1}$
$\beta = 90.379 (6)^\circ$	$T = 98 (2) \text{ K}$
$V = 2127.3 (11) \text{ \AA}^3$	Plate, colourless
$Z = 2$	$0.35 \times 0.15 \times 0.02 \text{ mm}$

### Data collection

Rigaku AFC12 $\kappa$ /SATURN724 diffractometer	4389 independent reflections
Radiation source: fine-focus sealed tube	4021 reflections with $I > 2\sigma(I)$
Monochromator: graphite	$R_{\text{int}} = 0.048$
$T = 98(2) \text{ K}$	$\theta_{\text{max}} = 26.5^\circ$
$\omega$ scans	$\theta_{\text{min}} = 2.4^\circ$
Absorption correction: multi-scan (ABSCOR; Higashi, 1995)	$h = -17 \rightarrow 18$
$T_{\text{min}} = 0.354$ , $T_{\text{max}} = 1$	$k = -13 \rightarrow 13$
14400 measured reflections	$l = -16 \rightarrow 16$

### Refinement

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.048$	H-atom parameters constrained
$wR(F^2) = 0.113$	$w = 1/[\sigma^2(F_o^2) + (0.04P)^2 + 8.4194P]$
$S = 1.10$	where $P = (F_o^2 + 2F_c^2)/3$
4389 reflections	$(\Delta/\sigma)_{\text{max}} = 0.001$
244 parameters	$\Delta\rho_{\text{max}} = 0.77 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	$\Delta\rho_{\text{min}} = -1.12 \text{ e \AA}^{-3}$
	Extinction correction: none

*Special details*

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted R-factor wR and goodness of fit S are based on  $F^2$ , conventional R-factors R are based on F, with F set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\sigma(F^2)$  is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on  $F^2$  are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.
