Received 13 August 2008; accepted 15 August 2008

Key indicators: single-crystal X-ray study; $T = 297$ K; mean $\sigma(C-C) = 0.004$ Å; R factor = 0.033; wR factor = 0.094; data-to-parameter ratio = 23.2.

In the title complex, $[ZnCl_2(C_6H_4N_2Se)_2]$, the Zn^{II} center is tetracoordinated by a Cl_2N_2 donor set in a distorted tetrahedral geometry. Some of the distortion from the ideal tetrahedral geometry might be ascribed to two agostic $Z\cdots H$ interactions. The two 2,1,3-benzoselenadiazole ligands are each essentially planar and form a dihedral angle of $35.06(9)^\circ$. An interesting feature of the crystal packing is the observation of short intermolecular contacts between Se and Se, Se and N, and N and N atoms. These arise as a result of three-center bridging of adjacent molecules into chains along the b axis. The crystal structure is stabilized by $\pi-\pi$ interactions [minimum centroid–centroid distance = $3.5694(18)$ Å].

Related literature

For related literature and applications of the 2,1,3-benzoselenadiazole molecule and its metal complexes, see, for example: Galet *et al.* (1994); Grivas (2000); Iwaoka & Tomoda (1994, 2000); Saiki *et al.* (1997); Zhou *et al.* (2005).

Bis(2,1,3-benzoselenadiazole- κN)dichloridozinc(II)

Hoong-Kun Fun, Annada C. Maity, Sibaprasad Maity, Shyamaprosad Goswami and Suchada Chantrapromma

S1. Comment

Metal complexes of 2,1,3-benzoselenadiazole continue to attract the interest of inorganic chemists (e.g. Grivas, 2000). Organoselenium derivatives stabilized by non-bonded Se···N interactions (Galet *et al.*, 1994); Iwaoka & Tomoda, 1994; 2000; Saiki *et al.*, 1997) are also of interest because of their vital roles in many chemical phenomena, such as molecular recognition and molecular packing in crystal phases as well as due to their biological roles (Zhou *et al.*, 2005). The reaction of 2,1,3-benzoselenadiazole with ZnCl₂ results in the formation of the title zinc(II) complex (I).

The structure of (I) comprises a neutral ZnCl₂L₂ molecule ($L = 2,1,3$ -benzoselenadiazole ligand), Fig. 1. The Zn^{II} ion is tetra-coordinated by two Cl⁻ ions and two N atoms derived from the L ligands. The L ligands are each essentially planar with the maximum deviation of 0.028 (2) Å being for atom N1 in one ligand and 0.044 (2) Å for the N3 atom in the other ligand. The dihedral angle between the their mean planes is 35.06 (9)[°]. The distorted tetrahedral geometry can be indicated by the bond angles subtended at Zn: N—Zn—N = 111.13 (9)[°], Cl—Zn—Cl = 122.58 (4)[°], and N—Zn—Cl in the range of 100.70 (6) - 110.81 (7)[°]. Some of the distortion from the ideal tetrahedral geometry might be ascribed to two agostic Zn···H interactions, Table 1.

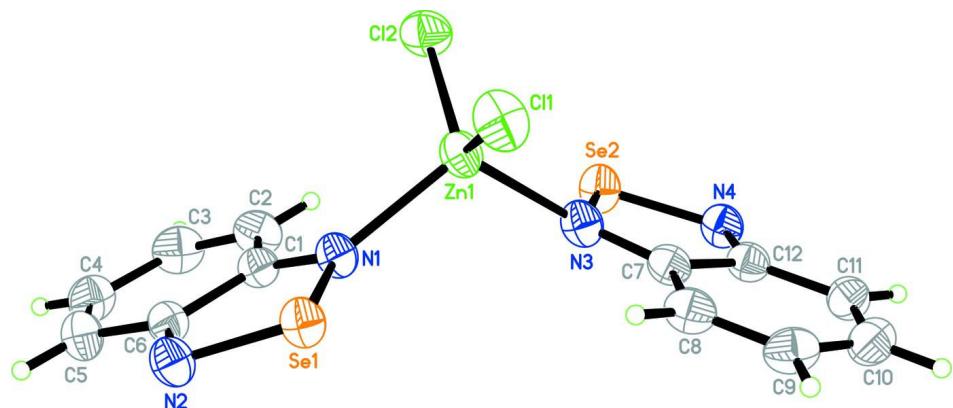

The interesting feature of the crystal packing is the observation of short intermolecular contacts between Se and Se, Se and N, and N and N atoms (Table 1). These arise as a result of three-center bridging of adjacent molecules into chains along the *b*-axis, Fig. 2. The crystal is further stabilized by π – π interactions with the shortest of these being 3.5694 (18) Å for Cg(C7/C12/N4/Se2/N3)···Cg(C7–C12)ⁱ for i: -*x*, 2-*y*, -*z*.

S2. Experimental

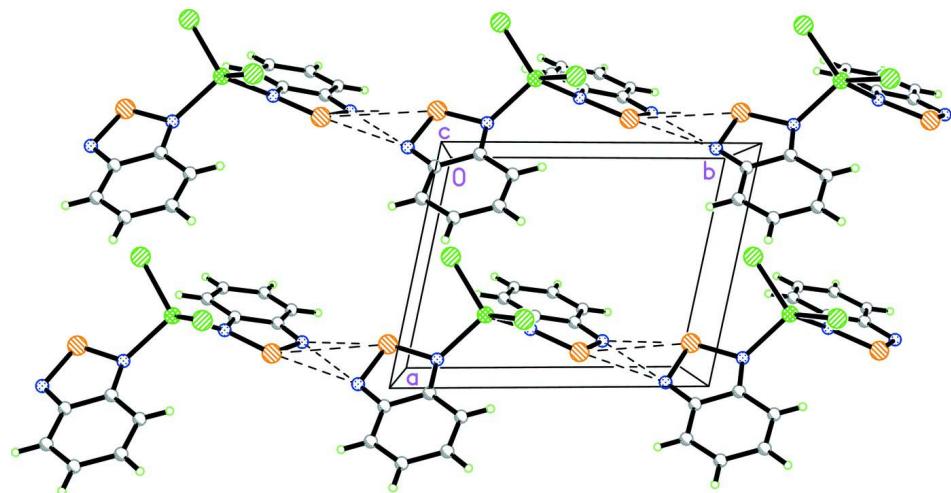

A slurry of 2,1,3-benzoselenadiazole (1 g, 5.4 mmol) and anhydrous zinc chloride (270 mg, 2.72 mmol) in dry methanol (15 ml) was heated at 343–353 K for 2 h. After completion of the reaction, the mixture was allowed to cool to room temperature and the precipitate (I) was collected by filtration. Recrystallization of (I) from 40% methanol in chloroform afforded a yellow microcrystalline solid (1.16 g, 85% yield).

S3. Refinement

All H atoms were placed in calculated positions with C—H = 0.93 Å, and with $U_{\text{iso}}=1.2U_{\text{eq}}(\text{C})$.

**Figure 1**

The molecular structure of (I), showing 50% probability displacement ellipsoids and the atomic numbering.

**Figure 2**

The crystal packing of (I), viewed along the c axis showing chains running along the [0 1 0] direction. Intermolecular contacts are shown as dashed lines (see Comment).

where $P = (F_o^2 + 2F_c^2)/3$
 $(\Delta/\sigma)_{\max} = 0.001$
 $\Delta\rho_{\max} = 0.79 \text{ e } \text{\AA}^{-3}$
 $\Delta\rho_{\min} = -0.54 \text{ e } \text{\AA}^{-3}$
Extinction correction: *SHELXTL* (Sheldrick,
2008), $F_c^* = kFc[1 + 0.001xFc^2\lambda^3/\sin(2\theta)]^{-1/4}$
Extinction coefficient: 0.0238 (15)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
