Received 26 August 2008; accepted 28 August 2008

 Key indicators: single-crystal X-ray study; $T = 295$ K; mean $\sigma(\text{C}-\text{C}) = 0.005$ Å; R factor = 0.036; wR factor = 0.101; data-to-parameter ratio = 15.8.

In the title compound, $\text{C}_{13}\text{H}_9\text{BrO}_2$, the molecular conformation is stabilized by an intramolecular $\text{O}-\text{H}\cdots\text{O}$ hydrogen bond. In the crystal structure, weak intermolecular $\text{C}-\text{H}\cdots\text{O}$ hydrogen-bonding interactions link the molecules into chains along the c -axis direction.

(5-Bromo-2-hydroxyphenyl)(phenyl)methanone

F.-K. Yang, Y.-N. Ding, W. Cheng and K. Xu

Comment

Monocondensed Schiff bases are attractive because of their intermediates in the synthesis of unsymmetrical multidentate Schiff base ligands and metal complexes, which serve as potential chelating agents and catalyst in synthesis and pharmaceutical fields (Hester *et al.*, 2001). New examples are being tested for their antitumor, (Idrees *et al.*, 2001). antimicrobial and antiviral activities (Sridhar & Saravanan, 2001). We describe the structure of the title compound is a precursor of monocondensed Schiff bases.

In the title compound, bond lengths are slightly different from those in similar compounds. The C—Br bond length [1.896 (3) Å] is longer than others reported [1.865 (1) (Dale *et al.*, 1999) and 1.884 (2) Å (Wiktor *et al.*, 2000)]. Molecular conformation is stabilized by an intramolecular O—H \cdots O hydrogen bond. In the crystal structure, weak intermolecular C—H \cdots O hydrogen bonding interactions (Table 1) link the molecules into chains along the *b*-direction.

Experimental

5-Bromo-2-hydroxybenzophenone was prepared *via* the Fries rearrangement of *p*-bromophenyl benzoate at 433 K with AlCl₃ as the catalyst. The title compound was collected and washed with 10% diluted hydrochloric acid. Single crystals suitable for X-ray measurements were obtained by recrystallization from absolute ethanol and acetic ether (1:1, *v/v*) at room temperature.

Refinement

All H atoms were placed at calculated positions and allowed to ride on their attached atoms, with C—H distance = 0.93 Å and O—H = 0.82 Å, and with $U_{\text{iso}} = 1.2 U_{\text{eq}}$ (C) and $U_{\text{iso}} = 1.5 U_{\text{eq}}$ (O).

Figures

Fig. 1. The structure of the title compound showing 30% probability displacement ellipsoids and the atom-numbering scheme.

Fig. 2. The packing of (I), viewed down the *b* axis.

(5-Bromo-2-hydroxyphenyl)(phenyl)methanone

Crystal data

$C_{13}H_9BrO_2$	$F_{000} = 552$
$M_r = 277.10$	$D_x = 1.685 \text{ Mg m}^{-3}$
Monoclinic, $P2_1/c$	Mo $K\alpha$ radiation
Hall symbol: -P 2ybc	$\lambda = 0.71073 \text{ \AA}$
$a = 15.938 (3) \text{ \AA}$	Cell parameters from 1025 reflections
$b = 5.8929 (12) \text{ \AA}$	$\theta = 1.3\text{--}27.0^\circ$
$c = 12.111 (2) \text{ \AA}$	$\mu = 3.74 \text{ mm}^{-1}$
$\beta = 106.15 (3)^\circ$	$T = 295 (2) \text{ K}$
$V = 1092.6 (4) \text{ \AA}^3$	Block, yellow
$Z = 4$	$0.30 \times 0.20 \times 0.10 \text{ mm}$

Data collection

Bruker SMART 1K CCD area-detector diffractometer	2292 independent reflections
Radiation source: fine-focus sealed tube	1767 reflections with $I > 2\sigma(I)$
Monochromator: graphite	$R_{\text{int}} = 0.026$
$T = 295(2) \text{ K}$	$\theta_{\text{max}} = 26.7^\circ$
Thin-slice ω scans	$\theta_{\text{min}} = 1.3^\circ$
Absorption correction: multi-scan (SADABS; Sheldrick, 2004)	$h = -19 \rightarrow 19$
$T_{\text{min}} = 0.417$, $T_{\text{max}} = 0.689$	$k = -7 \rightarrow 6$
4878 measured reflections	$l = -14 \rightarrow 15$

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.035$	H-atom parameters constrained
$wR(F^2) = 0.101$	$w = 1/[\sigma^2(F_o^2) + (0.0519P)^2 + 0.0875P]$
$S = 1.08$	where $P = (F_o^2 + 2F_c^2)/3$
2292 reflections	$(\Delta/\sigma)_{\text{max}} < 0.001$
145 parameters	$\Delta\rho_{\text{max}} = 0.36 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	$\Delta\rho_{\text{min}} = -0.61 \text{ e \AA}^{-3}$
	Extinction correction: none

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
