Received 5 September 2008; accepted 21 September 2008

Key indicators: single-crystal X-ray study; $T = 298$ K; mean $\sigma(\text{C}-\text{C}) = 0.004$ Å; R factor = 0.019; wR factor = 0.045; data-to-parameter ratio = 11.4.

In the title complex, $[\text{Ce}_2(\text{C}_8\text{H}_5\text{NO}_4)_3(\text{H}_2\text{O})_2]_n$, each Ce ion is in nine-coordinated environment. Eight O atoms from six ligands participate in coordination, in addition to one O atom from a water molecule. Both carboxylate groups from the ligands chelate the Ce atoms, forming two four-membered rings. The 5-aminoisophthalate ligands also bridge the Ce centers, forming a two-dimensional network, and $\text{O}-\text{H}\cdots\text{O}$ and $\text{N}-\text{H}\cdots\text{O}$ hydrogen bonds complete the structure.

Comment

5-aminoisophthalic acid forms covalent bonds with metal ions, especially with transition metals through nitrogen atom of amino group as well as oxygen atoms of carboxylic groups (Wu *et al.*, 2002a; Wu *et al.*, 2002b; Liao *et al.*, 2004) and with lanthanide ions as strong Pearson acids through oxygen atoms of carboxylic groups (Rzaczynska *et al.*, 1994). Carboxylic groups of acid have a great ability to form infinite connection with metal ions and remarkable versatility in adopting different modes of bonding—from unidentate, chelating and bridging, sometimes in more than one way in the same compound (Daiguebonne *et al.*, 2000). In this paper, we present a title complex, $(C_{24}H_{19}Ce_2N_3O_{14})_n$, (I), synthesized by a condensation reaction of 5-aminoisophthalic acid with cerous nitrate under the condition of high pressure.

The molecular structure of the title complex, (I), is shown in Fig. 1. The ligands construct a floor-like layer by chelating and bridging metal ions. The carboxy groups link layers in $\eta^1,3$ mode, thus resulting in one-dimension metal-channels along *b*-axis, and the water molecules coordinating with metal ions are pending in these channels.

Experimental

5-aminoisophthalic acid (0.3 mmol, 54.6 mg) and sodium hydroxide (0.3 mmol, 12.5 mg) dissolved in 20 ml water, heated to boiled and then stop heating. Cerous nitrate hexahydrate (0.3 mmol, 130.3 mg) dissolved in 5 ml water was mixed with the above solution, stirring for half an hour. Then transfer them into a 50 ml teflon reactor, under autogenous pressure at 160°C for 3 days and then cooled to room temperature, after which large brown block-shaped crystals of the title complex suitable for X-ray diffraction analysis were obtained.

Refinement

All H-atoms were positioned geometrically and refined using a riding model, with C—H 0.93 (aromatic) 0.93, N—H 0.86 (amino), O—H 0.85 Å (water), with $U_{iso}(H) = 1.2U_{eq}(C)$.

Figures

Fig. 1. The structure of the title complex, showing 30% probability displacement ellipsoids and the atom-numbering scheme.

Data collection

Siemens SMART CCD area-detector diffractometer	2233 independent reflections
Radiation source: fine-focus sealed tube	2001 reflections with $I > 2\sigma(I)$
Monochromator: graphite	$R_{\text{int}} = 0.034$
$T = 298(2) \text{ K}$	$\theta_{\text{max}} = 25.0^\circ$
φ and ω scans	$\theta_{\text{min}} = 2.3^\circ$
Absorption correction: multi-scan (SADABS; Sheldrick, 1996)	$h = -14 \rightarrow 13$
$T_{\text{min}} = 0.516$, $T_{\text{max}} = 0.545$	$k = -9 \rightarrow 9$
11818 measured reflections	$l = -30 \rightarrow 23$

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.019$	H-atom parameters constrained
$wR(F^2) = 0.045$	$w = 1/[\sigma^2(F_o^2) + (0.0208P)^2 + 2.5416P]$
$S = 1.04$	where $P = (F_o^2 + 2F_c^2)/3$
2233 reflections	$(\Delta/\sigma)_{\text{max}} = 0.001$
196 parameters	$\Delta\rho_{\text{max}} = 0.45 \text{ e \AA}^{-3}$
2 restraints	$\Delta\rho_{\text{min}} = -0.64 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
