Received 29 August 2008; accepted 2 September 2008

Key indicators: single-crystal X-ray study; $T = 293$ K; mean $\sigma(\text{C}-\text{C}) = 0.005$ Å; R factor = 0.036; wR factor = 0.086; data-to-parameter ratio = 20.5.The asymmetric unit of the title compound, $[\text{Zn}(\text{C}_2\text{H}_8\text{N}_2)_3]\text{Cl}_2 \cdot \text{H}_2\text{O}$, contains a discrete $[\text{Zn}(\text{C}_2\text{H}_8\text{N}_2)_3]^{2+}$ cation with a distorted octahedral geometry around Zn, two uncoordinated chloride ions and one water molecule. The crystal structure exhibits $\text{N}-\text{H} \cdots \text{O}$, $\text{N}-\text{H} \cdots \text{Cl}$ and $\text{O}-\text{H} \cdots \text{O}$ hydrogen bonds.

Tris(ethylenediamine)zinc(II) dichloride monohydrate

L. Cheng, Y.-Y. Sun, Y.-W. Zhang and G. Xu

Comment

The preparation of complexes including different stereoisomers is a fascinating and promising means. There are many complexes including $[\text{Zn}(\text{en})_3]^{2+}$ cation (en = ethylenediamine), which have been reported, due that $[\text{Zn}(\text{en})_3]^{2+}$ cation has two simple and intuitive stereoisomers (Bernhardt *et al.*, 2003; Cernak *et al.*, 1984; Emsley *et al.*, 1989; Muralikrishna *et al.*, 1983; Nesterova *et al.*, 2006; Wu *et al.*, 2001). Different from the similar compound $[\text{Zn}(\text{en})_3]\text{Cl}_2 \cdot 2\text{H}_2\text{O}$ (Muralikrishna *et al.*, 1983; Wu *et al.*, 2001), here, we report a salt $[\text{Zn}(\text{en})_3]\text{Cl}_2 \cdot \text{H}_2\text{O}$. In the asymmetric unit of the salt, there are only one crystal water molecule.

The asymmetric unit of the title salt, $[\text{Zn}(\text{en})_3]\text{Cl}_2 \cdot \text{H}_2\text{O}$, contains a discrete $[\text{Zn}(\text{en})_3]^{2+}$ cation, two uncoordinated chloride ions and one water molecule. The Zn(II) ion displays a distorted octahedral geometry, being surrounded by three en ligands. The Zn \cdots N distances are between 2.159 (2) and 2.220 (2) Å. Each en acts as a chelating bidentate ligand. In crystal, the $[\text{Zn}(\text{en})_3]^{2+}$ cations, chloride ions and the crystal water are linked together by N—H \cdots O, N—H \cdots Cl and O—H \cdots Cl hydrogen bonds (Table 2).

Experimental

To a solution of $\text{ZnCl}_2 \cdot 2\text{H}_2\text{O}$ (0.172 g, 1 mmol) in CH_3OH (5 ml), an aqueous solution (5 ml) of bib (bib = 1,3-bis(4,5-Dihydro-1*H*-imidazol-2-yl)benzene) (0.214 g, 1 mmol) was added. After the mixture was stirred for half an hour, a white precipitate formed. 3 ml en was added to the mixture and the precipitate disappeared. Then the mixture was stirred for an hour and filtered. The filtrate was allowed to evaporate slowly at room temperature. After 3 weeks, colorless block shaped crystals were obtained in 40% yield (0.034 g) based on Zn(II).

Refinement

H atoms were located in a difference map, but refined using a riding model with N—H = 0.90, O—H = 0.85 Å and C—H = 0.97 Å and with $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{iso}}(\text{C,N,O})$.

Figures

Fig. 1. The asymmetric unit of the title compound with 30% displacement ellipsoids.

Fig. 2. Partial packing diagram. The H atoms bonded to C atoms are omitted for clarity.

Refinement

Refinement on F^2

Least-squares matrix: full

$R[F^2 > 2\sigma(F^2)] = 0.035$

$wR(F^2) = 0.085$

$S = 1.10$

Secondary atom site location: difference Fourier map

Hydrogen site location: inferred from neighbouring sites

H-atom parameters constrained

$w = 1/[\sigma^2(F_o^2) + (0.0384P)^2 + 0.5868P]$

where $P = (F_o^2 + 2F_c^2)/3$

$(\Delta/\sigma)_{\max} < 0.001$

2975 reflections $\Delta\rho_{\max} = 0.39 \text{ e } \text{\AA}^{-3}$
 145 parameters $\Delta\rho_{\min} = -0.27 \text{ e } \text{\AA}^{-3}$
 Primary atom site location: structure-invariant direct methods Extinction correction: none

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
