Received 2 September 2008; accepted 5 September 2008

Key indicators: single-crystal X-ray study;  $T = 293\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$ ;  $R$  factor = 0.069;  $wR$  factor = 0.190; data-to-parameter ratio = 18.7.

In the title compound,  $\text{C}_{22}\text{H}_{23}\text{NO}$ , the dihedral angle between the naphthalenyl ring system and the benzene ring is  $73.32(6)^\circ$ . An intramolecular  $\text{O}-\text{H}\cdots\text{N}$  hydrogen bond stabilizes the molecular conformation. In the crystal structure, molecules are linked by  $\text{C}-\text{H}\cdots\pi$  interactions, resulting in zigzag chains parallel to the  $[10\bar{1}]$  direction.

## Related literature

## **1-[(Pyrrolidin-1-yl)(*p*-tolyl)methyl]naphthalen-2-ol**

**Chuanwei Wan and Hong Zhao**

### **S1. Comment**

Compounds derived from naphthalen-2-ol have been of great interest in organic chemistry (Szatmari & Fulop, 2004; Zhao & Sun, 2005). We report here the crystal structure of the title compound (Fig. 1).

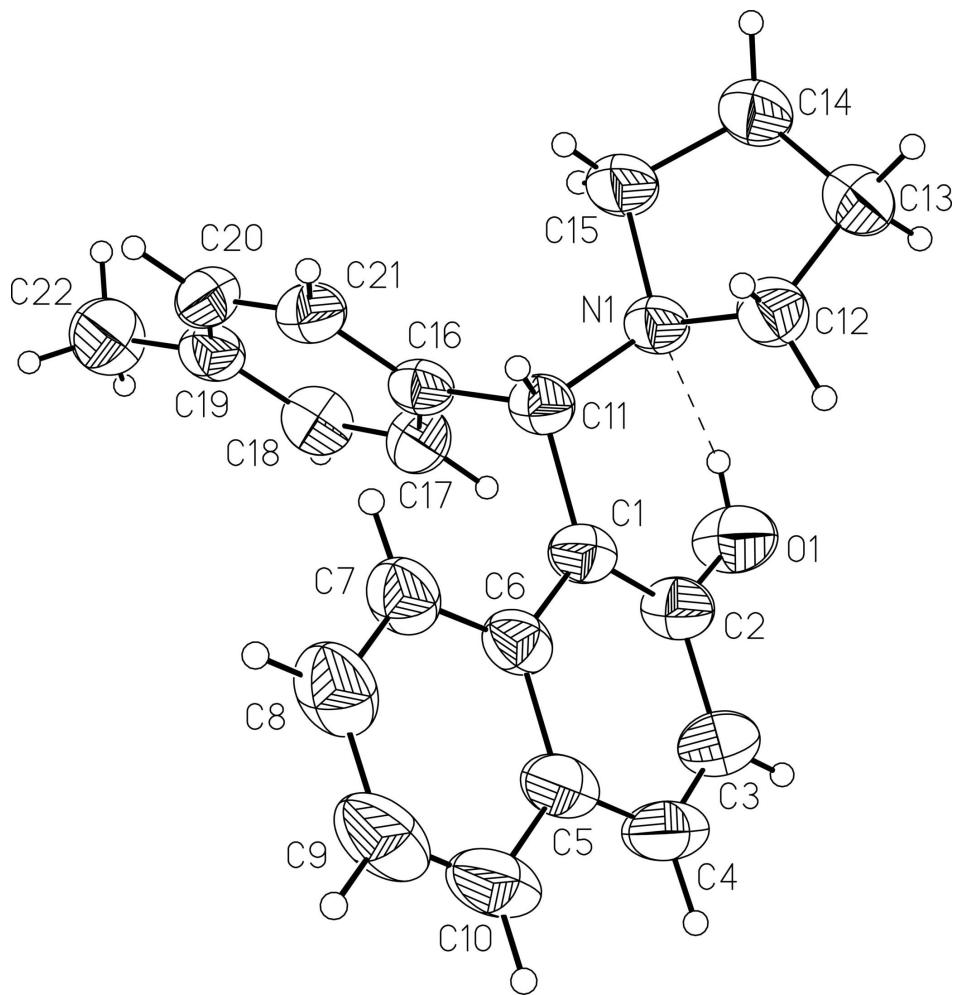

Bond lengths and angles in the title compound have normal values. The dihedral angle between the naphthyl and phenyl rings is 73.32 (6)°. The pyrrolidine ring adopts a twist conformation, as indicated by the puckering parameters ( $q_2 = 0.401$  (2) Å and  $\varphi = 169.2$  (4)°; Cremer & Pople, 1975) and the small value of the displacement asymmetry parameter ( $\Delta C_2(C14) = 0.0301$  (10)°; Nardelli, 1983). The molecular conformation is stabilized by a strong intramolecular O—H···N hydrogen bond (Table 1). In the crystal packing, molecules are linked through C—H···π interactions (Table 1) to form zig zag chains running along the [1 0 -1] direction.

### **S2. Experimental**

A dry 50 ml flask was charged with benzaldehyde (10 mmol), naphthalen-2-ol (10 mmol), and pyrrolidine (10 mmol). The mixture was stirred at 100°C for 10 h then ethanol (15 ml) was added. After heating under reflux for 30 minutes, the precipitate was filtrated off and washed 3 times with ethanol to give the title compound. Single crystals suitable for X-ray analysis were obtained by slow evaporation of a dichloromethane solution.

### **S3. Refinement**

All hydrogen atoms were calculated geometrically, with C—H = 0.93–0.98 Å, O—H = 0.82 Å, and refined as riding with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$  or  $1.2U_{\text{eq}}(\text{C}, \text{O})$  for methyl and hydroxy hydrogen atoms.

**Figure 1**

The structure of the title compound, showing the atom-numbering scheme. Displacement ellipsoids are drawn at the 50% probability level. The intramolecular O—H···N hydrogen bond is indicated by a dashed line.

 $(\Delta/\sigma)_{\max} = 0.005$   
 $\Delta\rho_{\max} = 0.25 \text{ e } \text{\AA}^{-3}$   
 $\Delta\rho_{\min} = -0.20 \text{ e } \text{\AA}^{-3}$

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
