Received 17 September 2008; accepted 22 September 2008

Key indicators: single-crystal X-ray study;  $T = 296\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.005\text{ \AA}$ ;  $R$  factor = 0.056;  $wR$  factor = 0.142; data-to-parameter ratio = 13.0.

In the title compound,  $\text{C}_{13}\text{H}_{10}\text{F}_3\text{NO}_2\text{S}$ , the dihedral angle between the thiazole and phenyl rings is  $5.15(1)^\circ$ . No intermolecular hydrogen bonding is observed in the crystal structure.

## Ethyl 2-phenyl-5-trifluoromethyl-1,3-thiazole-4-carboxylate

**Hai-Zhen Jiang, Wen Wan, Min Shao and Jian Hao**

### S1. Comment

1,3-Thiazole derivatives have attracted considerable attention because of various biological activities (Sasse *et al.*, 2002) and have broad applications in the materials science (Campeau *et al.*, 2008). Thiazole can be used as a core for developing pharmaceutically important molecules (Zifcsak & Hlasta, 2004). Trifluoromethyl substituted thiazole may be the most promising skeleton in medicinal chemistry (Rynbrandt *et al.*, 1981). The title compound, multiple substitute 1,3-thiazol with trifluoromethyl group at 5-position, has been obtained unexpectedly in the laboratory during trying to prepare 3-chloro-2-dibenzylamino-4,4,4-trifluoro-butyric acid ethyl ester by a reaction of 2-dibenzylamino-4,4,4-trifluoro-3-hydroxy-butyric acid ethyl ester with thionyl chloride. We present here the crystal structure of the title compound.

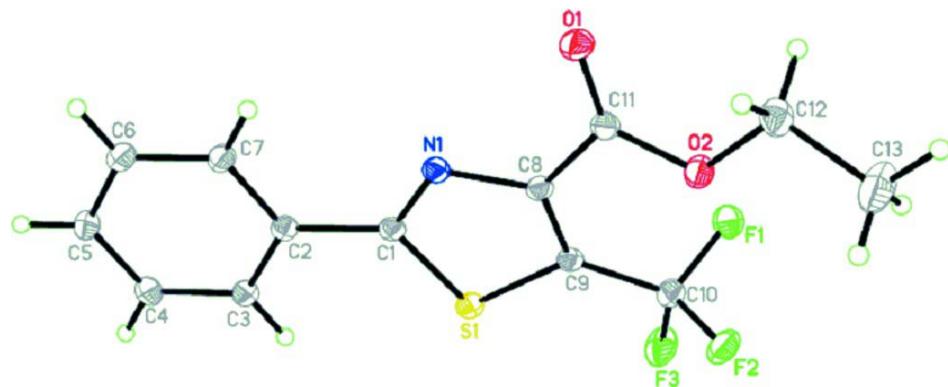

The molecular structure is shown in Fig. 1. The bond lengths in the thiazole moiety agree with those found in methyl 2-amino-5-isopropyl-1,3-thiazole-4-carboxylate (Kennedy *et al.*, 2004). The thiazole ring makes a dihedral angle of 5.15 (1) $^{\circ}$  with phenyl ring, showing the approximately coplanar molecular structure except for trifluoromethyl and ethoxy group. No intermolecular hydrogen bonding is observed in the crystal structure.

### S2. Experimental

A solution of 2-dibenzylamino-4,4,4-trifluoro-3-hydroxy-butyric acid ethyl ester (0.2 mmol) in 10 ml thionyl chloride was refluxed for a period of half an hour till the complete consumption of raw material. Excess thionyl chloride was evaporated, the residue was diluted with anhydrous ethanol (4 ml), then concentrated by rotary evaporator. The crude product was re-crystallized from ethanol (95%) and colorless needle-type crystals of (I) were obtained.

### S3. Refinement

All the H atoms were placed in geometrically idealized positions and constrained to ride their parent atoms, with C—H = 0.93 - 0.97 Å and  $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C})$  for methyl and  $1.2U_{\text{eq}}(\text{C})$  for others.

**Figure 1**

View of the title compound (I), shown the atom labeling scheme. Displacement ellipsoids are drawn at the 30% probability level. H atoms are represented by circles of arbitrary radii.

*Special details*

**Experimental.** IR (KBr,  $\text{cm}^{-1}$ ): 3061, 2980, 1737, 1633, 1513, 1461, 1290, 1210, 766, 689.  $^1\text{H}$  NMR ( $\text{CDCl}_3$ , 500 MHz).  $\delta/\text{p.p.m.}$ : 7.46–8.00 (m, 5H), 4.49 (q,  $J = 7.0 \text{ Hz}$ , 2H), 1.44 (t,  $J = 7.0 \text{ Hz}$ , 3H).  $^{13}\text{C}$  NMR ( $\text{CDCl}_3$ , 125 MHz).  $\delta/\text{p.p.m.}$ : 168.87, 160.27, 146.48, 131.77, 131.63, 129.24, 164.15 (q,  $^2J_{\text{C}-\text{F}} = 36.5 \text{ Hz}$ ,  $\text{CF}_3\text{C}-$ ), 123.33 (q,  $^1J_{\text{C}-\text{F}} = 269.3 \text{ Hz}$ ,  $-\text{CF}_3$ ), 62.41, 13.98.  $^{19}\text{F}$  NMR ( $\text{CDCl}_3$ , 470 MHz,  $\text{CFCl}_3$ ).  $\delta/\text{p.p.m.}$ : -52.44 (s).

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
