Received 29 September 2008; accepted 13 October 2008

Key indicators: single-crystal X-ray study;  $T = 120$  K; mean  $\sigma(\text{C}-\text{C}) = 0.004$  Å;  $R$  factor = 0.047;  $wR$  factor = 0.089; data-to-parameter ratio = 26.7.

The crystal structure of the title compound,  $[\text{Cu}_2(\text{C}_2\text{H}_4\text{O}_6\text{PS})(\text{OH})(\text{H}_2\text{O})_2]\cdot 3\text{H}_2\text{O}$ , consists of two  $\text{Cu}^{2+}$  ions, one  $(\text{O}_3\text{PC}_2\text{H}_4\text{SO}_3)^{3-}$  ion and one  $\text{OH}^-$  ion, as well as five water molecules, two of which are coordinated to  $\text{Cu}^{2+}$ . The  $\text{Cu}^{2+}$  ions are coordinated by six O atoms. The  $\text{CuO}_6$  polyhedra are connected by  $\mu$ - and  $\mu_3$ -O atoms into zigzag chains along the  $b$  axis. These chains are further connected by  $-\text{CH}_2\text{CH}_2-$  groups to form layers, in turn building a three-dimensional framework via hydrogen bonding.

## Poly[[diaqua- $\mu_2$ -hydroxido-( $\mu_7$ -2-phosphonatoethanesulfonato)dicopper(II)] trihydrate]

A. Sonnauer, A. Lieb and N. Stock

### Comment

Inorganic–organic hybrid materials based on metal carboxylates, sulfonates and phosphonates are intensively investigated due to their potential application in the field of gas separation, storage, as well as catalysis, or as sensor materials. We are interested in the use of organic ligands containing two or more different functional groups for the synthesis of functionalized hybrid compounds. Although a large number of metal phosphonates and metal sulfonates have been reported in the literature, compounds based on ligands containing simultaneously a phosphonic as well as a sulfonic acid group have only recently been investigated. These few studies are limited to the use of linker molecules based on rigid phosphonoarylsulfonic acids. Our group has started a systematic investigation using the flexible linker 2-phosphonoethansulfonic acid, which has been reported in the literature (Sonnauer *et al.*, 2007; Sonnauer & Stock, 2008*a,b*). Here we report the crystal structure of the new copper phosphonosulfonate  $\text{Cu}_2[(\text{O}_3\text{PC}_2\text{H}_4\text{SO}_3)(\text{OH})(\text{H}_2\text{O})_2](\text{H}_2\text{O})_3$ , which was obtained from a hydrothermal reaction in a glass tube.

The title compound consists of two crystallographic independent copper(II) ions, one fully deprotonated  $(\text{O}_3\text{PC}_2\text{H}_4\text{SO}_3)^{3-}$  anion, one hydroxide ion, as well as five water molecules (two coordinated to the copper ions)(Fig. 1). The copper ions are coordinated by six oxygen atoms and form  $\text{CuO}_6$  polyhedra. These polyhedra are connected by  $\mu$ -O and  $\mu_3$ -O atoms. Thus, Cu—O—Cu zigzag chains of edge-sharing polyhedra are observed (Fig. 2), which are connected by the organic group  $-\text{C}_2\text{H}_4-$  to form layers. These layers are connected *via* hydrogen bonds into a three-dimensional framework (Fig. 3).

### Experimental

$\text{H}_2\text{O}_3\text{PC}_2\text{H}_4\text{SO}_3\text{H}$  was synthesized as previously reported (Sonnauer & Stock, 2008*b*). All other reagents were of analytical grade (Aldrich and Fluka) and were used without further purification. The synthesis was performed in a glass reactor (DURAN culture tubes 12 × 100 mm D50 GL 14 M.KAP, SCHOTT 261351155). 263  $\mu\text{l}$  of 2.0 M  $\text{H}_3\text{L}$  (0.53 mmol), 536  $\mu\text{l}$  of 2.0 M  $\text{Cu}(\text{NO}_3)_2$  (1.06 mmol), and 789  $\mu\text{l}$  of 2.0 M  $\text{NaOH}$  (1.59 mmol) were mixed and  $\text{H}_2\text{O}$  was added to give the final volume of 2900  $\mu\text{l}$ . The mixture was heated at 90 °C for 24 h. After filtration single-crystals were isolated from the filtrate.

### Refinement

The hydrogen atoms of the C—H groups were positioned with idealized geometry and were refined using a riding model. The hydrogen atoms of the O—H groups were located in the Fourier difference map, their bond lengths were set to ideal values and afterwards the atom positions were refined using a riding model with  $U(\text{H}) = 1.2U_{\text{eq}}(\text{C})$  or  $U(\text{H}) = 1.5U_{\text{eq}}(\text{O})$ .

## Figures

Fig. 1. Asymmetric unit of the title compound. Displacement ellipsoids are drawn at the 50% probability level.

Fig. 2. Chains of edge-sharing CuO<sub>6</sub> polyhedra along the *b*-axis. Polyhedra are shaded in grey.

Fig. 3. The framework consists of layers, which are connected *via* hydrogen bonds (dotted line).

### Refinement

Refinement on  $F^2$

Secondary atom site location: difference Fourier map

Least-squares matrix: full

Hydrogen site location: inferred from neighbouring sites

$R[F^2 > 2\sigma(F^2)] = 0.047$

H-atom parameters constrained

$wR(F^2) = 0.089$

$$w = 1/[\sigma^2(F_o^2) + 7.2829P]$$

where  $P = (F_o^2 + 2F_c^2)/3$

$S = 1.11$

$(\Delta/\sigma)_{\max} < 0.001$

4352 reflections

$\Delta\rho_{\max} = 0.75 \text{ e } \text{\AA}^{-3}$

163 parameters

$\Delta\rho_{\min} = -0.78 \text{ e } \text{\AA}^{-3}$

Primary atom site location: structure-invariant direct methods

Extinction correction: none

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
