Received 21 September 2008; accepted 29 September 2008

Key indicators: single-crystal X-ray study; $T=273 \mathrm{~K}$; mean $\sigma(\mathrm{O}-\mathrm{C})=0.002 \AA$; $R$ factor $=0.030 ; w R$ factor $=0.080 ;$ data-to-parameter ratio $=14.9$.

In the title compound, $\mathrm{C}_{2} \mathrm{H}_{7} \mathrm{~N}_{2} \mathrm{O}_{2}{ }^{+} \cdot \mathrm{Cl}^{-} \cdot \mathrm{H}_{2} \mathrm{O}$, the non- H atoms of the cation are approximately coplanar. The organic cations, chloride ions and water molecules are linked into a twodimensional network parallel to the $b c$ plane by $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$, $\mathrm{N}-\mathrm{H} \cdots \mathrm{Cl}$ and $\mathrm{O}-\mathrm{H} \cdots \mathrm{Cl}$ hydrogen bonds.

## (Methoxycarbonyl)hydrazinium chloride monohydrate

Jian-Wu Xie, Lu-Ping Lv, Wen-Bo Yu, Wei-Wei Li and Xian-Chao Hu

## S1. Comment

Benzaldehydehydrazone derivatives have received considerable attention for a long time due to their pharmacological activity (Parashar et al., 1988) and their photochromic properties (Hadjoudis et al., 1987). The title compound is an important intermediate in the synthesis of benzaldehydehydrazone derivatives. We report here the crystal structure of the title compound (Fig. 1).

In the cation, atoms O1, O2, N2, C1 and C2 are coplanar (r.m.s. deviation $0.029 \AA$ ) and atom N1 deviates by 0.260 (2) $\AA$ from the $\mathrm{C} 1 / \mathrm{C} 2 / \mathrm{O} 1 / \mathrm{O} 2 / \mathrm{N} 2$ plane. The bond lengths and angles in the organic cation are comparable to those in a related structure (Song et al., 2003).
The molecules are linked into a two-dimensional network parallel to the $b c$ plane by $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}, \mathrm{N}-\mathrm{H} \cdots \mathrm{Cl}$ and $\mathrm{O}-\mathrm{H} \cdots \mathrm{Cl}$ hydrogen bonds involving the water molecule and chloride ions (Table 1 and Fig.2).

## S2. Experimental

Methyl hydrazinecarboxylate $(0.90 \mathrm{~g}, 0.01 \mathrm{~mol})$ was dissolved in ethanol- dilute HCl and single crystals suitable for Xray analysis were obtained by slow evaporation at room temperature (m.p. 463-465 K).

## S3. Refinement

O - and N -bound H atoms were located in a difference map and were refined with $\mathrm{O}-\mathrm{H}$ and $\mathrm{N} 2-\mathrm{H} 2$ distances restrained to 0.85 (2) $\AA$ and 0.87 (1) $\AA$, respectively. The methyl H atoms were disordered over two orientations and their occupancies were initially refined and later fixed at 0.75 and 0.25 , with C-H $=0.96$ å and $U_{\mathrm{iso}}(\mathrm{H})=1.5 U_{\mathrm{eq}}(\mathrm{C})$.

Figure 1
The molecular structure of the title compound, showing $30 \%$ probability displacement ellipsoids and the atomic numbering. Hydrogen bonds are shown as dashed lines.

Figure 2
The crystal packing of the title compound, viewed approximately along the $c$ axis. Hydrogen bonds are shown as dashed lines.

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors (gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
