Received 27 September 2008; accepted 8 October 2008

Key indicators: single-crystal X-ray study; $T = 120$ K; mean $\sigma(\text{C}-\text{C}) = 0.011$ Å; R factor = 0.043; wR factor = 0.165; data-to-parameter ratio = 23.4.

The asymmetric unit of the title compound, $[\text{Hg}_2\text{Br}_4(\text{C}_{12}\text{H}_{12}\text{N}_2)_2]$, contains one half-molecule. The Hg^{II} atom is five-coordinated in a trigonal-bipyramidal configuration by two N atoms from the chelating 4,4'-dimethyl-2,2'-bipyridine ligand, two bridging Br and one terminal Br atom, leading to a centrosymmetric dimeric molecule. There is a π - π contact between the pyridine rings [centroid-to-centroid distance = 3.756 (5) Å].

Comment

Recently, we reported the syntheses and crystal structures of [Zn(5,5'-dmbpy)Cl₂], (II), (Khalighi *et al.*, 2008), [Zn(6-mbpy)Cl₂], (III), (Ahmadi, Kalateh, Ebadi *et al.*, 2008), [HgI₂(4,4'-dmbpy)], (IV), (Yousefi, Tadayon Pour *et al.*, 2008), [Cd(5,5'-dmbpy)(μ -Cl)₂]_n, (V), (Ahmadi, Khalighi *et al.*, 2008), [Hg(5,5'-dmbpy)I₂], (VI), (Tadayon Pour *et al.*, 2008), [Cu(5,5'-dcbpy)(en)(H₂O)₂].2.5H₂O, (VII), (Yousefi, Khalighi *et al.*, 2008), [Hg(dmphen)I₂], (VIII), (Yousefi, Rashidi Vahid *et al.*, 2008), [In(4,4'-dmbpy)Cl₃(DMSO)], (IX), (Ahmadi, Kalateh, Abedi *et al.*, 2008), [In(5,5'-dmbpy)Cl₃(MeOH)], (X), (Kalateh *et al.*, 2008) and {[HgCl(dm4bt)]₂(μ -Cl)₂}, (XI), (Khavasi *et al.*, 2008) [where 5,5'-dmbpy is 5,5'-dimethyl-2,2'-bipyridine, 6-mbpy is 6-methyl-2,2'-bipyridine, 4,4'-dmbpy is 4,4'-dimethyl-2,2'-bipyridine, 5,5'-dcbpy is 2,2'-bipyridine-5,5'-dicarboxylate, en is ethylenediamine, dmphen is 4,7-diphenyl-1,10-phenanthroline, DMSO is dimethyl sulfoxide and dm4bt is 2,2'-dimethyl-4,4'-bithiazole]. There are two Hg^{II} dimer complexes, with formula, [{HgBr(N—N)}₂(μ -Br)₂], such as [{HgBr(bipy)}₂(μ -Br)₂], (XII), (Craig *et al.*, 1974) and [{HgBr(pquin)}₂(μ -Br)₂], (XIII), (Perlepes *et al.*, 1995) [where bipy is 2,2'-bipyridine and pquin is 2-(2'-pyridyl)quinoxaline] have been synthesized and characterized by single-crystal X-ray diffraction methods. We report herein the synthesis and crystal structure of the title compound, (I).

The asymmetric unit of the title compound, (I), contains one half-molecule (Fig. 1). The Hg^{II} atom is five-coordinated in a trigonal-bipyramidal configuration by two N atoms from the chelating 4,4'-dimethyl-2,2'-bipyridine ligand, two bridging Br and one terminal Br atoms. The Hg—Br and Hg—N bond lengths and angles (Table 1) are within normal ranges, as in (XII) and (XIII).

In the crystal structure, the π - π contact (Fig. 2) between the pyridine rings, Cg3—Cg4ⁱ [symmetry code: (i) 2 - x, 2 - y, -z, where Cg3 and Cg4 are centroids of the rings (N1/C1—C3/C5—C6) and (N2/C7—C9/C11—C12), respectively] may stabilize the structure, with centroid-centroid distance of 3.756 (5) Å.

Experimental

For the preparation of the title compound, (I), a solution of 4,4'-dimethyl-2,2'-bipyridine (0.20 g, 1.10 mmol) in methanol (5 ml) was added to a solution of HgBr₂ (0.40 g, 1.10 mmol) in methanol (5 ml) at room temperature. The suitable crystals for X-ray analysis were obtained by methanol diffusion to a colorless solution in DMSO. Suitable crystals were isolated after one week (yield; 0.44 g, 73.4%).

Refinement

H atoms were positioned geometrically, with C—H = 0.93 and 0.96 Å for aromatic and methyl H, respectively, and constrained to ride on their parent atoms with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$.

Figures

Fig. 1. The molecular structure of the title molecule, with the atom-numbering scheme. Displacement ellipsoids are drawn at the 50% probability level.

Fig. 2. A partial packing diagram of the title compound.

 Extinction coefficient: 0.025 (3)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
