Received 14 October 2008; accepted 24 October 2008

Key indicators: single-crystal X-ray study;  $T = 298\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.007\text{ \AA}$ ;  $R$  factor = 0.055;  $wR$  factor = 0.114; data-to-parameter ratio = 14.1.

In the crystal structure of the title compound,  $(\text{C}_{12}\text{H}_{11}\text{Cl}_2\text{N}_2)_2^{\cdot}[\text{Ni}(\text{C}_4\text{N}_2\text{S}_2)_2]^{\cdot}2^-$ , the  $\text{Ni}^{II}$  complex dianion is located on an inversion centre. The  $\text{Ni}^{II}$  atom is coordinated by four S atoms in a square-planar geometry. In the cation, the dihedral angle between the benzene and pyrazine rings is  $85.2(2)^\circ$ .

## **Bis[1-(2,6-dichlorobenzyl)-3-methylpyrazin-1-i um] bis(maleonitriledithiolato)nickelate(II)**

**Shan-Shan Yu, Hua Xian and Zheng-Fang Tian**

### **S1. Comment**

Molecular solids based on transition metal dithiolene complexes have attracted intense interest in recent years, not only owing to the fundamental research of magnetic interactions and magneto-structural correlations but also to the development of new functional molecule-based materials (Robertson & Cronin, 2002). Much work has been performed in molecular solids based on  $M[\text{dithiolene}]_2$  complexes owing to their application as building blocks in molecular-based materials showing magnetic, superconducting and optical properties (Nishijo *et al.*, 2000; Ni *et al.*, 2005). Herein, we report the crystal structure of the title compound, (I).

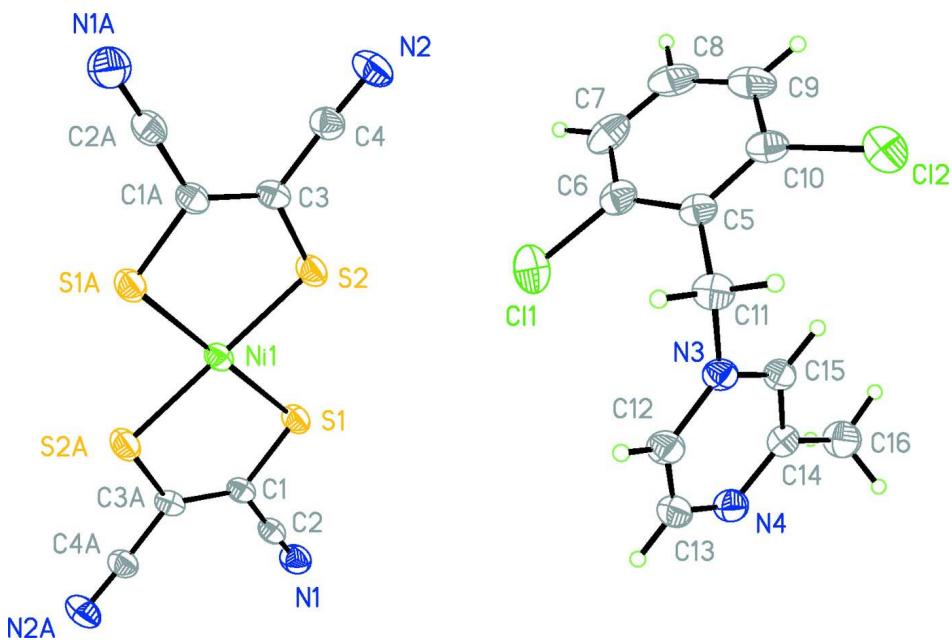

The molecular structure of (I) is illustrated in Fig. 1. Compound (I) crystallizes in monoclinic system, with one half  $[\text{Ni}(\text{mnt})_2]^{2-}$  dianion and one 1-(2,6-dichlorobenzyl)-3-methylpyrazine cation in an asymmetric unit. The anion  $[\text{Ni}(\text{mnt})_2]^{2-}$  possesses an approximated planar geometry and most of the bond lengths and angles are in good agreement with the various  $[\text{Ni}(\text{mnt})_2]^{2-}$  compounds (Ni *et al.*, 2004; Ren *et al.*, 2004).

### **S2. Experimental**

Disodium maleonitriledithiolate (456 mg, 2.5 mmol) and nickel chloride hexahydrate (297 mg, 1.25 mmol) were mixed under stirring in water (20 mL) at room temperature. Subsequently, a solution of 1-(2,6-dichlorobenzyl)-3-methylpyrazine iodide (952 mg, 2.5 mmol) in methanol (10 mL) was added to the mixture. The black precipitate that was immediately formed was filtered off and washed with methanol. The crude product was recrystallized in acetone (20 mL) to give black block crystals. Anal. Calcd. for  $\text{C}_{32}\text{H}_{22}\text{Cl}_4\text{N}_8\text{NiS}_4$ : C 48.73, H 2.81, N 14.21%. Found: C 48.69, H 2.78, N 14.09%.

### **S3. Refinement**

The H atoms were placed in geometrically idealized positions (C—H = 0.93–0.97 Å) and refined as riding atoms, with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ .

**Figure 1**

The molecular structure of (I), showing the atom-numbering scheme and displacement ellipsoids at the 30% probability level. The suffix A corresponds to symmetry code ( $-x, -y+1, -z$ ).

$$(\Delta/\sigma)_{\max} = 0.001$$

$$\Delta\rho_{\max} = 0.51 \text{ e \AA}^{-3}$$

$$\Delta\rho_{\min} = -0.30 \text{ e \AA}^{-3}$$

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
