Received 19 September 2008; accepted 1 October 2008

Key indicators: single-crystal X-ray study;  $T = 295\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$ ;  $R$  factor = 0.028;  $wR$  factor = 0.072; data-to-parameter ratio = 17.1.

The title compound,  $\text{C}_6\text{H}_5\text{NS}_4$ , consists of a planar 2-thioxo-1,3-dithiol-4-ylsulfanyl unit [maximum deviation from the ring plane = 0.0325 (2)  $\text{\AA}$ ], with a cyanoethylsulfanyl substituent in the 4-position. In the crystal structure, weak intermolecular  $\text{C}-\text{H}\cdots\text{S}$  hydrogen bonds together with  $\text{S}\cdots\text{N}$  interactions [3.260 (5)  $\text{\AA}$ ] form two-dimensional layers in the  $bc$  plane.

## 3-(2-Thioxo-1,3-dithiol-4-ylsulfanyl)propanenitrile

Bang-Tun Zhao, Jing-Jing Ding and Gui-Rong Qu

### S1. Comment

Tetrathiafulvalenes (TTFs) and their charge-transfer salts have become an interesting topic of research, due to their high electrical conductivity and superconducting properties (Segura & Martin, 2001). 1,3-Dithiole-2-thiones, important precursors to TTF derivatives, have also attracted attention (Chen, *et al.*; 2005; Fabre, 2004). In 2001, 4-alkylthio-1,3-dithiole-2-thione, a key kind of 1,3-dithiole-2-thiones was developed by a facile approach (Jia, *et al.*, 2001). We report here the structure of the title compound (Fig. 1), which was prepared by the reaction of di(tetraethylammonium) bis(1,3-dithiole-2-thione-4,5-dithiolate)zincate and 3-bromopropionitrile in the presence of pyridine hydrochloride.

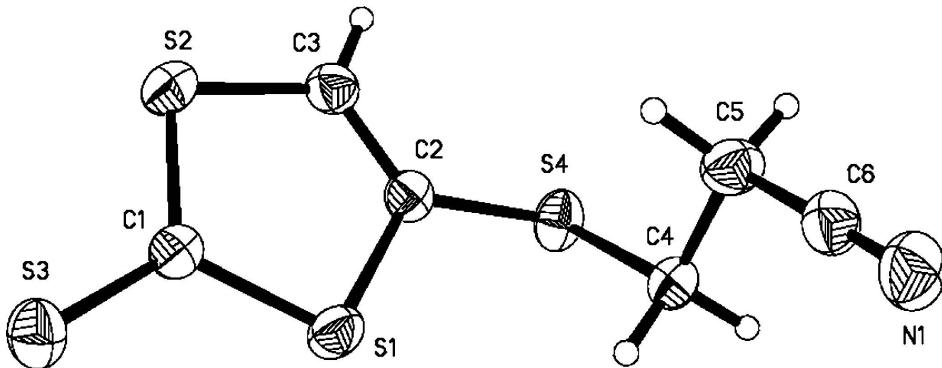

The atoms of the five-membered dithiole ring and the doubly-bonded atom S3 are nearly coplanar, with a maximum deviation from the least-squares plane of only 0.0325 (2) Å (S1). However, S4 deviates considerably from the plane, 0.0775 (4) Å, which is very similar to the structure of 4,5-bis(2-cyanoethylthio)-1,3-dithiol-2-one (Liu, *et al.*, 2002). The cyanoethylsulfanyl group is substituted on the C2 atom of the dithiole ring. The C4—S4 bond length (1.8191 (19) Å) is typical of a single bond, while the other C—S bond lengths range from 1.650 (2) Å to 1.7435 (19) Å, suggesting a degree of conjugation in the dithiole-2-thione system. In the crystal structure weak intermolecular C5—H5B···S3 hydrogen bonds, Table 1, together with S···N (3.260 (5) Å) interactions form two dimensional layers in the *bc* plane (Fig. 2).

### S2. Experimental

The title compound was prepared according to the literature (Jia, *et al.*, 2001). Orange block-like single crystals were obtained from slow evaporation of a dichloromethane solution at room temperature.

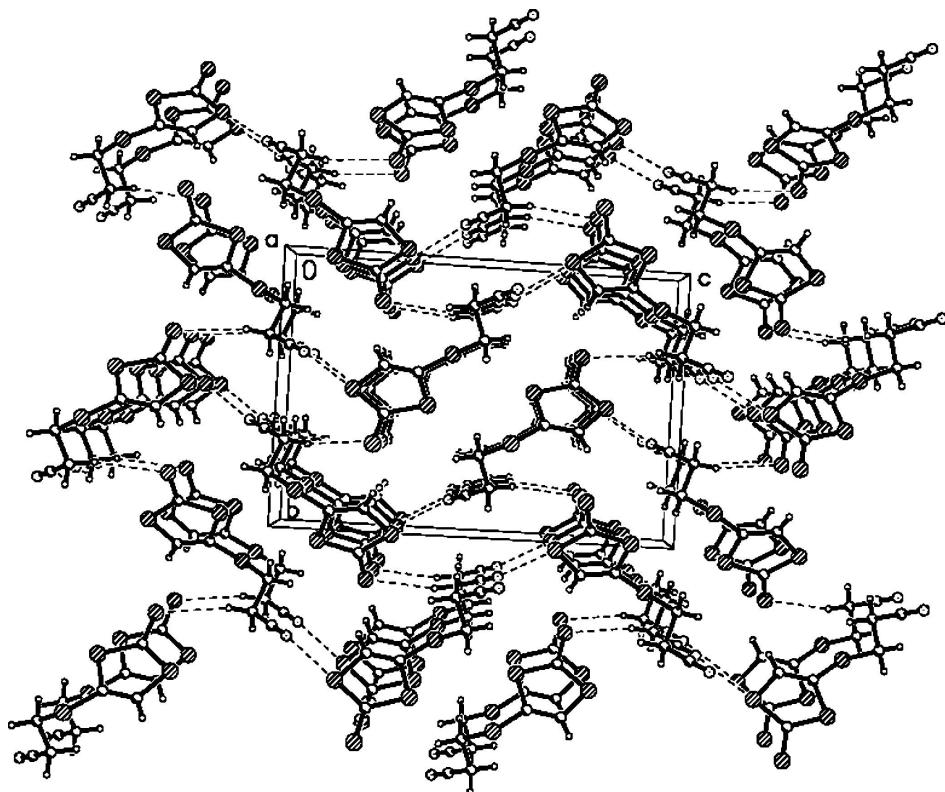

### S3. Refinement

All H-atoms were positioned geometrically and refined using a riding model with  $d(\text{C-H}) = 0.93\text{\AA}$ ,  $U_{\text{iso}}=1.2U_{\text{eq}}(\text{C})$  for aromatic and  $0.97\text{\AA}$ ,  $U_{\text{iso}} = 1.2U_{\text{eq}}(\text{C})$  for  $\text{CH}_2$  atoms.

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
