Department of Chemistry, Zhengzhou University, Zhengzhou 450052, People's Republic of China

Correspondence e-mail: wujie@zzu.edu.cn

Received 20 October 2008; accepted 7 November 2008

 Key indicators: single-crystal X-ray study; $T = 293$ K; mean $\sigma(\text{C}-\text{C}) = 0.014$ Å; R factor = 0.062; wR factor = 0.119; data-to-parameter ratio = 15.3.

In the title complex, $[\text{HgI}_2(\text{C}_{17}\text{H}_{13}\text{N}_5\text{O}_2)] \cdot \text{C}_3\text{H}_7\text{NO}$, the Hg atom is coordinated by two I atoms and two N atoms from two different ligands in a distorted tetrahedral environment. Hg atoms are bridged by *N,N'*-di-3-pyridylpyridine-2,6-dicarboxamide ligands, forming a helical chain running along the a axis.

Related literature

Comment

The expansion of the field of metal-organic frameworks (MOFs) of predetermined structure depends on the judicious choice of new linkers and nodes of appropriate coordination algorithms. Rigid, polydentate N-donor ligands are typical linkers employed in such work. The rigid conjugated clamp-like multi-pyridine ligand *N,N'*-bis(pyridin-3-yl)-2,6-pyridinedicarboxamide, is a convenient bridging ligand for the synthesis of chain complexes. However, the previous work proved that the ligand also can form binuclear complex with 28-number ring (Huang *et al.*; 2004, Qin *et al.* 2003; Baer *et al.* 2002). We think, among the factors that induce the self-assembly processes with this ligand, the rotation of terminal pyridine groups plays a crucial role in deciding between binuclear *versus*. extended structures of the metal complexes. In this work, we selected this ligand as linker, generating a new helical chain coordination complex, $\{[\text{HgI}_2(\text{C}_{17}\text{N}_5\text{O}_2)](\text{DMF})\}_n$, (I), which is reported here. In compound (I) each Hg(II) atom is four-coordinated by two N atoms from two ligands and two I atoms in a distorted tetrahedral coordination sphere (Fig. 1). The Hg(II) atoms are bridged with *N,N'*-bis(pyridin-3-yl)-2,6-pyridinedicarboxamide ligands to form a helical chain running the *a* axis (Fig. 2).

In the crystal structure, the intermolecular N—H \cdots N hydrogen bonds and the N—H \cdots O hydrogen bonds arising from the DMF and ligand complete the structure.

Experimental

The ligand *N,N'*-bis(pyridin-3-yl)-2,6-pyridinedicarboxamide (0.05 mmol, 0.016 g) in DMF (5 ml) was added dropwise to a solution of HgI₂ (0.1 mmol, 0.036 g) in methanol (3 ml). The precipitate was filtered and the resulting solution was allowed to stand at room temperature in the dark. After one week good quality colorless crystals were obtained from the filtrate and dried in air.

Figures

 291 parameters $\Delta\rho_{\min} = -0.92 \text{ e } \text{\AA}^{-3}$
 Primary atom site location: structure-invariant direct methods Extinction correction: none

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
