Received 13 November 2008; accepted 16 November 2008

Key indicators: single-crystal X-ray study; $T = 120$ K; mean $\sigma(C-C) = 0.014$ Å; R factor = 0.053; wR factor = 0.140; data-to-parameter ratio = 23.1.

In the molecule of the title compound, $[HgBr_2(C_{10}H_9N_3)]$, the Hg^{II} atom is four-coordinated in a distorted tetrahedral configuration by two N atoms from the chelating di-2-pyridylamine ligand and by two Br atoms. In the crystal structure, intermolecular $N-H \cdots Br$ hydrogen bonds link the molecules into centrosymmetric dimers. There are $\pi-\pi$ contacts between the pyridine rings [centroid-centroid distances = 3.9662 (5) and 3.9321 (4) Å]. There also exists a $C-H \cdots \pi$ contact between the pyridine CH group and a pyridine ring.

Dibromido(di-2-pyridylamine- κ^2N,N')mercury(II)

K. Kalateh, A. Norouzi, A. Ebadi, R. Ahmadi and V. Amani

Comment

Recently, we reported the syntheses and crystal structures of [Hg(4,4'-dmbpy) I₂], (II), (Yousefi, Tadayon Pour *et al.*, 2008), [Hg(5,5'-dmbpy)I₂], (III), (Tadayon Pour, *et al.*, 2008), [Hg(dmphen)I₂], (IV), (Yousefi, Rashidi Vahid *et al.*, 2008), {[HgCl(dm4bt)]₂(μ -Cl)₂}, (V), (Khavasi *et al.*, 2008), [Hg(6-mbpy)Cl₂], (VI), (Ahmadi *et al.*, 2008) and [{HgBr(4,4'-dmbpy)}₂(μ -Br)₂], (VII), (Kalateh *et al.*, 2008) [where 4,4'-dmbpy is 4,4'-dimethyl-2,2'-bipyridine, 5,5'-dmbpy is 5,5'-dimethyl-2,2'-bipyridine, 6-mbpy is 6-methyl-2,2'-bipyridine, dmphen is 4,7-diphenyl-1,10-phenanthroline and dm4bt is 2,2'-dimethyl-4,4'-bithiazole]. There are two Hg^{II} complexes, with formula, [Hg(N—N)Br₂], such as [Hg(TPA)Br₂], (VIII), (Xie *et al.*, 2004) and [Hg(TPD)Br₂], (IX), (Hughes *et al.*, 1985) [where TPA is tris(2-pyridyl)amine and TPD is *N,N,N',N'*-Tetramethyl-*o*-phenylenediamine] have been synthesized and characterized by single-crystal X-ray diffraction methods. We report herein the synthesis and crystal structure of the title compound, (I).

In the title compound, (Fig. 1), the Hg^{II} atom is four-coordinated in a distorted tetrahedral configuration by two N atoms from di-2-pyridylamine and two Br atoms. The Hg-Br and Hg-N bond lengths and angles (Table 1) are within normal ranges, as in (VIII).

In the crystal structure, intermolecular N-H...Br hydrogen bonds link the molecules into centrosymmetric dimers (Fig. 2), in which they may be effective in the stabilization of the structure. The π - π contacts between the pyridine rings Cg2...Cg2ⁱ and Cg2...Cg3ⁱⁱ [symmetry codes: (i) $x, -y, 2 - z$, (ii) $1 - x, -y, 2 - z$, where Cg2 and Cg3 are centroids of the rings A (N1/C1-C5) and B (N3/C6-C10), respectively] may further stabilize the structure, with centroid-centroid distances of 3.9662 (5) %A and 3.9321 (4) %A, respectively. There also exists a C—H... π contact (Table 1) between the pyridine CH group and pyridine ring.

Experimental

For the preparation of the title compound, (I), a solution of di-2-pyridylamine (0.25 g, 1.43 mmol) in methanol (20 ml) was added to a solution of HgBr₂ (0.51 g, 1.43 mmol) in acetonitrile (20 ml) and the resulting colorless solution was stirred for 20 min at 313 K. This solution was left to evaporate slowly at room temperature. After one week, colorless prismatic crystals of the title compound were isolated (yield; 0.55 g, 72.3%).

Refinement

H atoms were positioned geometrically, with N-H = 0.86 Å (for NH) and C-H = 0.93 Å for aromatic H and constrained to ride on their parent atoms, with $U_{iso}(H) = 1.2U_{eq}(C,N)$. The highest and lowest peaks are located 0.69 Å and 0.78 Å from Hg1 atom, respectively.

Figures

Fig. 1. The molecular structure of the title molecule, with the atom-numbering scheme. Displacement ellipsoids are drawn at the 50% probability level.

Fig. 2. A partial packing diagram of the title compound.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.053$	H-atom parameters constrained
$wR(F^2) = 0.140$	$w = 1/[\sigma^2(F_o^2) + (0.0882P)^2 + 2.3955P]$
$S = 1.15$	where $P = (F_o^2 + 2F_c^2)/3$
3350 reflections	$(\Delta/\sigma)_{\max} = 0.059$
145 parameters	$\Delta\rho_{\max} = 4.33 \text{ e } \text{\AA}^{-3}$
Primary atom site location: structure-invariant direct methods	$\Delta\rho_{\min} = -6.54 \text{ e } \text{\AA}^{-3}$
	Extinction correction: none

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
