Received 11 October 2008; accepted 6 November 2008

Key indicators: single-crystal X-ray study;  $T = 81$  K; mean  $\sigma(C-C) = 0.001$  Å;  $R$  factor = 0.033;  $wR$  factor = 0.090; data-to-parameter ratio = 26.1.

In the title benzamide derivative,  $C_{11}H_{14}ClNO$ , the chlorobenzene and butylamine groups are each planar, with mean deviations from the planes of 0.013 and 0.030 Å, respectively, and a dihedral angle of 2.54 (9)° between the two planes. In the crystal structure,  $N-H \cdots O$  hydrogen bonds link molecules in rows along  $a$ . Short intermolecular  $Cl \cdots Cl$  interactions [3.4225 (5) Å] link these rows into sheets in the  $ac$  plane. Additional weak  $C-H \cdots O$  and  $C-H \cdots \pi$  interactions generate a three-dimensional network.

## N-Butyl-4-chlorobenzamide

**Aamer Saeed, Rasheed Ahmad Khera, Naeem Abbas, Jim Simpson and Roderick G. Stanley**

### S1. Comment

The benzamilide core is present in compounds with such a wide range of biological activities that it has been called a privileged structure. N-substituted benzamides are well known anticancer compounds and the mechanism of action for N-substituted benzamide-induced apoptosis has been studied, using declopramide as a lead compound (Olsson *et al.*, 2002). N-substituted benzamides inhibit the activity of nuclear factor- B and nuclear factor of activated T cells activity while inducing activator protein 1 activity in T lymphocytes (Lindgren *et al.*, 2001). Various N-substituted benzamides exhibit potent antiemetic activity (Vega-noverola *et al.*, 1989), while heterocyclic analogs of benzamilide derivatives are potassium channel activators (Calderone *et al.*, 2006). o-Aryloxylation of N-substituted benzamides induced by the copper(II)/trimethylamine N-oxide system has been studied (Reinaud *et al.*, 1991). N-Alkylated 2-nitrobenzamides are intermediates in the synthesis of dibenzo[b,e][1,4]diazepines (Zhichkin *et al.*, 2007) and N-Acyl-2-nitrobenzamides are precursors of 2,3-disubstituted 3H-quinazoline-4-ones (Beccalli *et al.*, 2005). A one-pot conversion of 2-nitro-n-aryl-benzamides to 2,3-dihydro-1H-quinazoline-4-ones has also been reported (Yoo *et al.*, 2005). The anomalous dual fluorescence of benzamilides has been assigned to the two lowest benzamilide singlet states (Lewis & Long, 1998).

As part of our work on the structure of benzamilides and related compounds, we report here the structure of the title benzamide derivative, I, Fig. 1. The C1–C7/Cl system is planar with a maximum deviation of 0.0161 (7) Å from the least squares plane. The carbonyl oxygen atom O1 is displaced by 0.6102 (10) Å from this plane. The butylamine N1/C8–C11 fragment is also planar, maximum deviation 0.0365 (7) Å for C9. The dihedral angle between these two planes is 2.54 (9) °. Bond distances within the molecule are normal (Allen *et al.*, 1987) and similar to those found in the structures of related 4-chlorobenzamide derivatives (Saeed *et al.*, 2008, Hempel *et al.*, 2005).

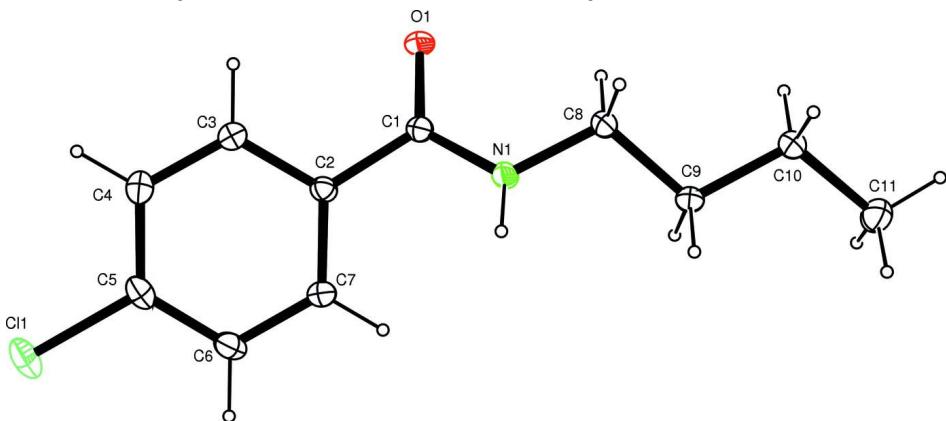

In the crystal structure N1—HN1···O1 hydrogen bonds, Table 1, link molecules into rows along *a*. Cl1···Cl1 interactions at 3.4225 (5) Å bridge these rows to form sheets in the *ac* plane, Fig. 2. The sheets are interconnected by weak C3—H3···O1 hydrogen bonds and C8—H8···π interactions involving the C2···C7 benzene ring to generate a three dimensional network, Fig. 3.

### S2. Experimental

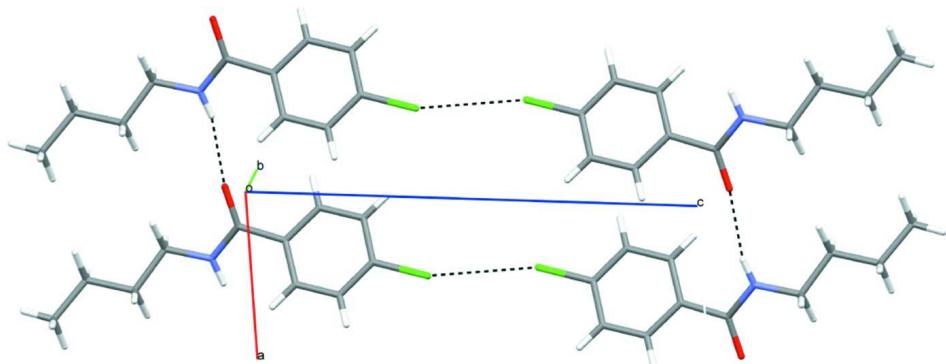

2-Fluorobenzoyl chloride (1 mmol) in CHCl<sub>3</sub> was treated with cyclohexyl amine (3.5 mmol) under a nitrogen atmosphere at reflux for 5 h. Upon cooling, the reaction mixture was diluted with CHCl<sub>3</sub> and washed consecutively with 1 M aq HCl and saturated aq NaHCO<sub>3</sub>. The organic layer was dried over anhydrous sodium sulfate and concentrated under reduced pressure. Crystallization of the residue in ethanol afforded the title compound (79 %) as white needles: Anal. calcd. for C<sub>11</sub>H<sub>14</sub>CINO: C 62.41, H 6.67, N 6.62%; found: C 62.34, H 7.16, N 6.57%.

**S3. Refinement**

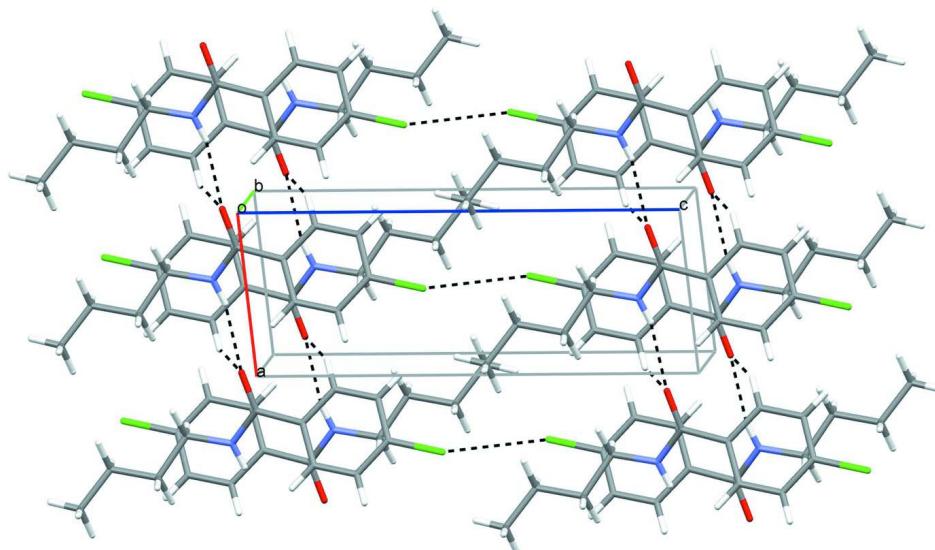

The H atom bound to N1 was located in a difference electron density map and refined freely with an isotropic displacement parameter. All other H-atoms were refined using a riding model with  $d(C—H) = 0.95 \text{ \AA}$ ,  $U_{\text{iso}} = 1.2U_{\text{eq}}(\text{C})$  for aromatic,  $0.99 \text{ \AA}$ ,  $U_{\text{iso}} = 1.2U_{\text{eq}}(\text{C})$  for  $\text{CH}_2$ , and  $0.98 \text{ \AA}$ ,  $U_{\text{iso}} = 1.5U_{\text{eq}}(\text{C})$  for  $\text{CH}_3$  H atoms.

**Figure 1**

### N-Butyl-4-chlorobenzamide

#### Crystal data

$C_{11}H_{14}ClNO$   
 $M_r = 211.68$   
Triclinic,  $P\bar{1}$   
Hall symbol: -P 1  
 $a = 5.1702 (4) \text{ \AA}$   
 $b = 7.8979 (5) \text{ \AA}$   
 $c = 13.2978 (9) \text{ \AA}$   
 $\alpha = 89.275 (3)^\circ$   
 $\beta = 84.863 (4)^\circ$   
 $\gamma = 77.165 (4)^\circ$   
 $V = 527.29 (6) \text{ \AA}^3$

$Z = 2$   
 $F(000) = 224$   
 $D_x = 1.333 \text{ Mg m}^{-3}$   
Mo  $K\alpha$  radiation,  $\lambda = 0.71073 \text{ \AA}$   
Cell parameters from 3494 reflections  
 $\theta = 5.3\text{--}66.2^\circ$   
 $\mu = 0.33 \text{ mm}^{-1}$   
 $T = 81 \text{ K}$   
Irregular fragment, colourless  
 $0.42 \times 0.30 \times 0.08 \text{ mm}$

#### Data collection

Bruker APEXII CCD area-detector  
diffractometer  
Radiation source: fine-focus sealed tube  
Graphite monochromator  
 $\omega$  scans  
Absorption correction: multi-scan  
(SADABS; Bruker, 2006)  
 $T_{\min} = 0.820$ ,  $T_{\max} = 0.974$

6632 measured reflections  
3445 independent reflections  
3050 reflections with  $I > 2\sigma(I)$   
 $R_{\text{int}} = 0.017$   
 $\theta_{\max} = 33.1^\circ$ ,  $\theta_{\min} = 3.1^\circ$   
 $h = -7 \rightarrow 6$   
 $k = -11 \rightarrow 11$   
 $l = -20 \rightarrow 20$

#### Refinement

Refinement on  $F^2$   
Least-squares matrix: full  
 $R[F^2 > 2\sigma(F^2)] = 0.033$   
 $wR(F^2) = 0.090$   
 $S = 1.04$   
3445 reflections  
132 parameters

0 restraints  
Primary atom site location: structure-invariant  
direct methods  
Secondary atom site location: difference Fourier  
map  
Hydrogen site location: inferred from  
neighbouring sites

H atoms treated by a mixture of independent  
and constrained refinement  
 $w = 1/[\sigma^2(F_o^2) + (0.0471P)^2 + 0.125P]$   
 where  $P = (F_o^2 + 2F_c^2)/3$

$(\Delta/\sigma)_{\max} = 0.002$   
 $\Delta\rho_{\max} = 0.43 \text{ e } \text{\AA}^{-3}$   
 $\Delta\rho_{\min} = -0.22 \text{ e } \text{\AA}^{-3}$

#### Special details

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted R-factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional R-factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\text{sigma}(F^2)$  is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and R-factors based on ALL data will be even larger.
