Received 29 October 2008; accepted 21 November 2008

Key indicators: single-crystal X-ray study;  $T = 296$  K; mean  $\sigma(\text{C}-\text{C}) = 0.003$  Å; disorder in main residue;  $R$  factor = 0.019;  $wR$  factor = 0.047; data-to-parameter ratio = 18.3.

In the title compound,  $\text{Na}^+\cdot\text{C}_6\text{H}_4\text{IO}_3\text{S}^-\cdot\text{H}_2\text{O}$ , the Na atom is hexacoordinated by O atoms, forming a two-dimensional sheet-like structure in the  $bc$  plane, with the iodobenzene rings protruding above and below.  $\text{Na}\cdots\text{O}$  contact distances are in the range 2.419 (2)–2.7218 (18) Å and  $\text{O}\cdots\text{Na}\cdots\text{O}$  angles are in the range 73.70 (5)–158.64 (7)°. The crystal structure is stabilized by  $\text{O}-\text{H}\cdots\text{O}$  and  $\text{C}-\text{H}\cdots\text{O}$  hydrogen bonds and  $\text{C}-\text{H}\cdots\pi$  interactions. The I atom is disordered over two positions with occupancies of 0.78 (2) and 0.22 (2).

## Sodium 2-iodobenzenesulfonate monohydrate

M. N. Arshad, M. N. Tahir, I. U. Khan, M. Shafiq and W. A. Siddiqui

### Comment

In the continuation to our research work on the synthesis of biologically active benzothiazine derivatives (Arshad *et al.*, 2008; Shafiq, Khan, Tahir & Siddiqui, 2008; Shafiq, Tahir, Khan, Ahmad & Siddiqui, 2008; Tahir *et al.*, 2008), we synthesized the title compound, (I).

The molecular structure of compound (I) is illustrated in Fig. 1. The bond lengths and bond angles, as far as the 2-iodobenzenesulfonate is concerned, are similar to those reported for the potassium salt analogue, reported on recently (Arshad *et al.*, 2008). The Na-atom is hexa-coordinated with O-atoms, involving four from the sulfonic groups and two water molecules. The range of the Na $\cdots$ O distances is 2.419 (2)–2.7218 (18) Å, whereas the range of O $\cdots$ Na $\cdots$ O angles is 73.70 (5)–158.64 (7)°. In this way a two-dimensional sheet-like structure in the bc plane is formed, with the iodobenzene rings protruding above and below.

It is interesting that one of the O-atoms of the sulfonic group is not involved in coordination with the Na-atom, but makes an intermolecular hydrogen bond with a water molecule, similar to the situation on the potassium salt analogue mentioned above. Also, one of the H-atoms of the H<sub>2</sub>O molecule is not involved in intra or intermolecular H-bonding.

In the crystal structure of compound (I) a two dimensional polymeric network extending along the *b* axis is formed (Fig. 2). There exist O-H $\cdots$ O and C-H $\cdots$ O hydrogen bonds, and C-H $\cdots$  $\pi$ -interactions involving the centroid, *Cg*, of the benzene ring, see Table 1 for details.

### Experimental

The title compound was prepared following the method used by Chau & Kice (1977). Suitable crystals for X-ray analysis were obtained from the reaction mixture.

### Refinement

The Iodine atom was disordered over two positions (I1A/I1B) with occupancies of 0.78 (2)/0.22 (2). The water H-atoms were located in a difference Fourier map and were refined with distance restraints: O-H = 0.82 (2) Å with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{O})$ . The C-bound H-atoms were positioned geometrically and treated as riding atoms: C—H = 0.93 Å and  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ .

## Figures

Fig. 1. Molecular structure of compound (I), with the atom numbering scheme. The thermal ellipsoids are drawn at the 50% probability level.

Fig. 2. A view along the c axis of the crystal packing in compound (I), showing the coordination of the O-atoms with the sodium atom and the hydrogen bonding involving the water molecules (H-atoms not involved in hydrogen bonding have been removed for clarity).

*Refinement*

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.019$	H-atom parameters constrained
$wR(F^2) = 0.047$	$w = 1/[\sigma^2(F_o^2) + (0.0176P)^2 + 0.7234P]$
$S = 1.05$	where $P = (F_o^2 + 2F_c^2)/3$
2339 reflections	$(\Delta/\sigma)_{\max} = 0.009$
128 parameters	$\Delta\rho_{\max} = 0.42 \text{ e } \text{\AA}^{-3}$
Primary atom site location: structure-invariant direct methods	$\Delta\rho_{\min} = -0.42 \text{ e } \text{\AA}^{-3}$
	Extinction correction: none

*Special details*

**Geometry.** Bond distances, angles *etc.* have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
