1-(Phthalimidomethyl)pyridinium *p*-toluenesulfonate

 Mark Daniel Bartholomä, Wayne Ouellette and
Jon Zubietta*

 Department of Chemistry, Syracuse University, Syracuse, New York 13244, USA
Correspondence e-mail: jazubiet@syr.edu

Received 6 November 2008; accepted 19 November 2008

 Key indicators: single-crystal X-ray study; $T = 90$ K; mean $\sigma(\text{C}-\text{C}) = 0.003$ Å; R factor = 0.054; wR factor = 0.124; data-to-parameter ratio = 17.0.

In the crystal of the title compound, $\text{C}_{14}\text{H}_{11}\text{N}_2\text{O}_2^+ \cdot \text{C}_7\text{H}_7\text{O}_3\text{S}^-$, the cation and anion interact by way of an aromatic $\pi-\pi$ interaction [centroid-centroid separation = $3.5783(2)$ Å] and a T-stacking ($\text{C}-\text{H} \cdots \pi$) interaction between cations. The dihedral angle between the aromatic rings in the cation is $61.73(8)^\circ$. The ionic units are aligned in a zigzag fashion in the b -axis direction.

1-(Phthalimidomethyl)pyridinium *p*-toluenesulfonate

M. D. Bartholomä, W. Ouellette and J. Zubieta

Comment

Radiolabeled nucleosides and nucleoside analogs may be good candidates for imaging and therapeutic applications because of their metabolic entrapment in rapidly dividing cells like tumor cells. These radiolabeled nucleoside derivatives may act as substrates for the human cytosolic thymidine kinase (hTK-1), an enzyme of the salvage pathway which catalyzes the phosphorylation of nucleosides to their corresponding 5'-monophosphates (Welin *et al.*, 2004). The phosphorylation would mainly occur in proliferating tumor cells since hTK-1 shows a dramatically increased activity in tumor cells compared to quiescent cells (Bello, 1974). The phosphorylated nucleosides would be entrapped inside the proliferating cells because of their negatively charged phosphate moiety retarding the cellular efflux (Arner *et al.*, 1995). Thus, a radiolabeled nucleoside analog could be used as probe for tumor cell proliferation since the entrapment results in an accumulation in tissue with elevated hTK-1 activity. The main problem for the development of a suitable nucleoside analog lies in the narrow substrate specificity of hTK-1 (Eriksson *et al.*, 2002). The natural substrates for hTK-1 are thymidine and uridine. Major modifications of the corresponding nucleoside, however, may lead to a highly decreased activity. The literature on the interaction of thymidine derivatives with hTK-1 is not totally unambiguous about the effects of various substitutions. For example, N-3 derivatized thymidine analogs have been reported to be inactive (Celen *et al.*, 2007). On the other hand, N-3 modified carboranylalkyl thymidine analogs show acceptable conversion rates (Al-Madhoun *et al.*, 2002). Therefore, we made a set of several thymidine and uridine analogs modified at different positions of the ribose and the base moiety to get further insight on the effects of various derivatizations. To expand our SAAC concept (single amino acid chelate) for radioimaging and radiotherapeutic purposes on nucleosides, the title phthalimidomethylpyridinium *p*-toluenesulfonate salt, (I), was prepared as part of a series of tosylalkylphthalimide derivatives recently synthesized in our group. This series is used for the attachment of a SAAC chelate at the N-3 and C-5 position of the base moiety of thymidine (Bartholomä *et al.* unpublished results). The SAAC chelate allows hereby the radiolabelling of thymidine and uridine derivatives by the coordination of the $[M(\text{CO})_3]^+$ core ($M = {}^{186/188}\text{Re}, {}^{99m}\text{Tc}$) (Wei *et al.*, 2005). The ideal decay properties, low cost and convenient availability of ${}^{99m}\text{Tc}$ from generator columns make the corresponding nucleoside complexes interesting candidates for imaging purposes while their corresponding rhenium complexes could be used as therapeutic counterparts.

Due to the tetrahedral arrangement of the connecting methyl group, the phthalimidomethylpyridinium cation in (I) is not planar. The tosylate anion sits on top of one end of the pyridinium residue showing aromatic π - π interaction. The centroid distance between those two aromatic rings is 3.5783 (2) Å. The other end of the pyridinium moiety shows some interaction with the phthalimide part of neighbored phthalimidomethyl-pyridinium cation. Thus, a T-stacking between the pyridinium residue and the benzyl ring of the phthalimide residue occurs (Table 1). The distances between the interacting C—H of the phthalimide and the centroid of the pyridinium residue are C2–Centroid = 3.5313 (2) Å and H2–Centroid = 2.70 Å, respectively. The corresponding angle C2–H2…Centroid is 147°. The phthalimide moiety itself has a planar geometry. All bond length and angles fall in expected ranges. In the crystal, the ionic units are aligned in a zigzag arrangement in direction of the *b* axis.

Experimental

2.00 g (11.29 mmol) *N*-(Hydroxymethyl)phthalimide were dissolved in 20 ml anhydrous pyridine under an inert atmosphere followed by a dropwise addition of 3.23 g (16.93 mmol, 1.5 equiv.) *p*-Toluenesulfonyl chloride in 20 ml anhydrous pyridine. After complete addition of the tosylchloride, the reaction mixture was stirred for additional 16 h. About 2 h after the addition was completed, a white precipitate started to form. This white solid was filtered off, washed three times with 100 ml chloroform, and finally dried for several days at h.v.. The product was obtained in good yields as a colourless amorphous powder (3.80 g, quantitative); colourless blocks of (I) suitable for X-ray diffraction were collected directly from the reaction mixture. $^1\text{H NMR}$ (d_6 -DMSO): δ = 2.28 (s, 3 H), 6.41 (s, 2 H), 7.10 (d, J = 7.98 Hz, 2 H), 7.47 (d, J = 7.95 Hz, 2 H), 7.90–7.99 (m, 4 H), 8.20 (t, J = 7.05 Hz, 2 H), 8.67 (t, J = 7.68 Hz, 1 H), 9.09 (d, J = 5.80 Hz, 2 H). p.p.m.. IR: ν = 3398 (br), 3124, 3087, 3037, 2980, 2935, 1781, 1729, 1627, 1485, 1404, 1361, 1331, 1300, 1268, 1206, 1168, 1116, 1089, 1067, 1031, 1008, 951, 826, 801, 777, 728, 680, 632, 587, 565, 529 cm^{-1} .

Refinement

The H atoms were placed in calculated positions and refined as riding.

1-(Phthalimidomethyl)pyridinium *p*-toluenesulfonate

Crystal data

$C_{14}H_{11}N_2O_2^+ \cdot C_7H_7O_3S^-$	$F_{000} = 856$
$M_r = 410.43$	$D_x = 1.481 \text{ Mg m}^{-3}$
Monoclinic, $P2_1/c$	Mo $K\alpha$ radiation
Hall symbol: -P 2ybc	$\lambda = 0.71073 \text{ \AA}$
$a = 7.6944 (5) \text{ \AA}$	Cell parameters from 3297 reflections
$b = 33.626 (2) \text{ \AA}$	$\theta = 2.4\text{--}26.4^\circ$
$c = 7.9426 (5) \text{ \AA}$	$\mu = 0.21 \text{ mm}^{-1}$
$\beta = 116.416 (1)^\circ$	$T = 90 (2) \text{ K}$
$V = 1840.5 (2) \text{ \AA}^3$	Block, colourless
$Z = 4$	$0.30 \times 0.25 \times 0.20 \text{ mm}$

Data collection

Bruker APEX CCD diffractometer	4482 independent reflections
Monochromator: graphite	3753 reflections with $I > 2\sigma(I)$
Detector resolution: 512 pixels mm^{-1}	$R_{\text{int}} = 0.049$
$T = 90(2) \text{ K}$	$\theta_{\text{max}} = 28.1^\circ$
ω scans	$\theta_{\text{min}} = 2.4^\circ$
Absorption correction: multi-scan (SADABS; Sheldrick, 2008)	$h = -10 \rightarrow 10$
$T_{\text{min}} = 0.939$, $T_{\text{max}} = 0.958$	$k = -42 \rightarrow 44$
19080 measured reflections	$l = -10 \rightarrow 10$

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.054$	H-atom parameters constrained
$wR(F^2) = 0.124$	$w = 1/[\sigma^2(F_o^2) + (0.0508P)^2 + 1.1529P]$
$S = 1.12$	where $P = (F_o^2 + 2F_c^2)/3$
4482 reflections	$(\Delta/\sigma)_{\text{max}} < 0.001$
263 parameters	$\Delta\rho_{\text{max}} = 0.61 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	$\Delta\rho_{\text{min}} = -0.38 \text{ e \AA}^{-3}$
	Extinction correction: none

supplementary materials

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
