Received 26 November 2008; accepted 27 November 2008

 Key indicators: single-crystal X-ray study; $T = 100$ K; mean $\sigma(\text{C}-\text{C}) = 0.002$ Å; R factor = 0.032; wR factor = 0.110; data-to-parameter ratio = 15.8.

In the molecule of the title compound, $\text{C}_{11}\text{H}_{14}\text{N}_2\text{O}_2\text{S}$, the five-membered ring adopts an envelope conformation and an intramolecular $\text{N}-\text{H}\cdots\text{O}$ hydrogen bond occurs. Intramolecular $\text{N}-\text{H}\cdots\text{O}$, $\text{C}-\text{H}\cdots\text{S}$ and $\text{C}-\text{H}\cdots\text{N}$ hydrogen bonds result in the formation of two five- and one six-membered rings, having twisted conformations. In the crystal structure, intermolecular $\text{N}-\text{H}\cdots\text{O}$, $\text{N}-\text{H}\cdots\text{S}$ and $\text{C}-\text{H}\cdots\text{S}$ hydrogen bonds link the molecules, forming polymeric sheets. The $\pi-\pi$ contacts between the isoindole ring systems, [centroid-centroid distances = 3.5883 (8) and 4.0619 (8) Å] may further stabilize the structure. A $\text{C}-\text{H}\cdots\pi$ interactions also occur.

Comment

Isoindoles and their derivatives are of great pharmaceutical importance (Mancilla *et al.*, 2007). Certain derivatives of isoindoles have shown a wide range of herbicidal activities (Toru *et al.*, 1986). The title compound is in continuation of the syntheses of isoindoles along with their derivatives and characterizations with the help of X-ray crystallography (Maliha *et al.*, 2007; Maliha, Hussain *et al.*, 2008; Maliha, Tariq *et al.*, 2008).

In the molecule of title compound (Fig 1), the bond lengths (Allen *et al.*, 1987) and angles are within normal ranges. Ring A (C2-C7) is, of course, planar, while the five-membered ring B (N1/C1/C2/C7/C8) adopts envelope conformation with C8 atom displaced by 0.141 (3) Å from the plane of the other ring atoms. The intramolecular N-H \cdots O, C-H \cdots S and C-H \cdots N hydrogen bonds (Table 1) result in the formation of two five- and one six-membered rings: C (N1/S1/C8/C11/H8), D (O1/N1/N2/C1/C11/H2N) and E (O1/N1/C1/C9/H9C), respectively, having twisted conformations.

In the crystal structure, intermolecular N-H \cdots O, N-H \cdots S and C-H \cdots S hydrogen bonds (Table 1) link the molecules to form polymeric sheets, in which the orientations of O—CH₃ groups cause to the R and S-configurations at the carbon atoms, C1 and C8, respectively. The behaviour of the O—CH₃ groups are not identical, because only opposite of S-atom is involved in intramolecular H-bonding. The π - π contacts between the isoindole ring systems, CgB—CgBⁱ and CgB—CgAⁱ [symmetry code: (i) -x, y, 1/2 - z, where CgA and CgB are centroids of the rings A (C2-C7) and B (N1/C1/C2/C7/C8)] may further stabilize the structure, with centroid-centroid distances of 3.5883 (8) Å and 4.0619 (8) Å. There also exist two C—H \cdots π interactions (Table 1).

Experimental

For the preparation of the title compound, ortho-phthaldehyde (1.34 g, 200 mmol) and thiourea (0.76 g, 200 mmol) were added to distilled water (250 ml), and aqueous NaOH (5 ml, 5%) was added dropwise with constant stirring. After 3 h, a colorless precipitate was obtained, which was washed with hexane, ethanol, acetone and methanol, respectively. Then, it was further refluxed in methanol for 2 h, and left to stand overnight. The deep red tiny crystals settled down, which were washed with ether, hexane and cold methanol, respectively. Crystals suitable for X-ray analysis were obtained from a solution of acetone/methanol mixture by slow evaporation at room temperature.

Refinement

H1, H8 (for CH) and H1N, H2N (for NH₂) atoms were located in difference syntheses and refined [C-H = 0.972 (17) and 0.979 (16) Å, N-H = 0.891 (17) and 0.826 (17) Å; U_{iso}(H) = 1.2U_{eq}(C,N). The remaining H atoms were positioned geometrically, with C-H = 0.95 and 0.98 Å for aromatic and methyl H, respectively, and constrained to ride on their parent atoms with U_{iso}(H) = xU_{eq}(C), where x = 1.5 for methyl H and x = 1.2 for aromatic H atoms.

Figures

Fig. 1. The molecular structure of the title molecule, with the atom-numbering scheme. Displacement ellipsoids are drawn at the 50% probability level. Hydrogen bonds are shown as dashed lines.

Fig. 2. A partial packing diagram of the title compound. Hydrogen bonds are shown as dashed lines.

159 parameters	$\Delta\rho_{\max} = 0.44 \text{ e } \text{\AA}^{-3}$
Primary atom site location: structure-invariant direct methods	$\Delta\rho_{\min} = -0.37 \text{ e } \text{\AA}^{-3}$
	Extinction correction: none

Special details

Geometry. Bond distances, angles *etc.* have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
