Received 30 October 2008; accepted 8 December 2008

Key indicators: single-crystal X-ray study; $T = 120\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; R factor = 0.015; wR factor = 0.030; data-to-parameter ratio = 24.2.

In the title compound, *trans*-[PtCl₂(C₇H₉N)₂], the Pt^{II} atom is located on an inversion center and is coordinated by two 3,4-dimethylpyridine ligands and two chloride ligands, resulting in a typical slightly distorted square-planar geometry. The crystallographic inversion centre forces the value of the C—N—N—C torsion angle to be linear and the 3,4-dimethylpyridine ligands to be coplanar.

***trans*-Dichloridobis(3,4-dimethylpyridine)platinum(II)**

Alexander N. Chernyshev, Nadezhda A. Bokach, Youlia A. Izotova and Matti Haukka

S1. Comment

The complex *trans*-[PtCl₂(C₇H₉N)₂] has an inversion symmetry and the Pt^{II} atom is situated at an inversion center and it is coordinated by two 3,4-dimethylpyridine ligands and two chloro ligands and exhibit *trans* configuration. Such arrangement of ligands leads to the square planar geometry. In the coordination polyhedron, all angles are very close to the ideal value of 90°. The crystallographic inversion centre forces the value of the torsion angle C1—N1—N1ⁱ—Cⁱ (symmetry operation i: -x, -y, -z) to be 180° and the the 3,4-dimethyl-pyridine ligands to be coplanar.

The geometry of 3,4-dimethylpyridine ligands resembles the geometry of the uncoordinated 3,4-dimethylpyridine, *i.e.* the C—C and C—N bond distances and angles in the coordinated 3,4-dimethylpyridine agree well with the expected value (Bond, Davies, 2002). The bond distance Pt—N (2.0148 (18) Å) is similar to the Pt—N bond lengths in other related compounds (Orpen *et al.*, 1989). The Pt—Cl bond lengths agree well with the reported values (See Table 2).

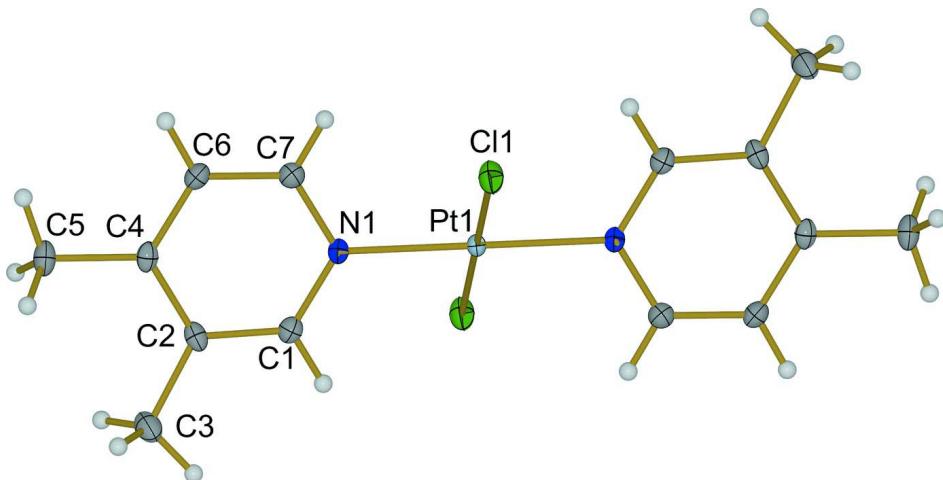

All *trans*-[PtCl₂L₂] complexes given in Table 2 have the same coordination environment as in the title compound. Indeed, they are square-planar and their pyridine rings lie in the same plane. The N—Pt—N and Cl—Pt—Cl angles in all observed compounds are equal to 180°, the angles N—Pt—Cl are very close to 90°.

S2. Experimental

3,4-dimethylpyridine (1 ml) was added to the powder of K₂[PtCl₄] (0.2 g) and the resulting mixture was heated to 150°C until the complete evaporation of the 3,4-dimethylpyridine. The resulting complex was recrystallized from CHCl₃ (yield 92%). Crystals were obtained by slow evaporation of CHCl₃ solution. Anal. calc. for C₁₄H₁₈N₂Cl₂Pt:C, 35.01; H, 3.78; N, 5.83%. Found: C, 35.30; H, 3.96; N, 5.54%.

S3. Refinement

Hydrogen atoms were positioned geometrically and constrained to ride on their parent atoms, with C—H = 0.95–0.98 Å, and U_{iso}~ = 1.2–1.5 U_{eq}~(parent atom). The highest peak is located 0.87 Å from atom Pt1 and the deepest hole is located 0.83 Å from atom Pt1.

**Figure 1**

The molecular structure of the title molecule, with the atom-numbering scheme. Displacement ellipsoids are drawn at the 50% probability level.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
