Received 30 November 2008; accepted 16 December 2008

Key indicators: single-crystal X-ray study;  $T = 294$  K; mean  $\sigma(\text{C}-\text{C}) = 0.002 \text{ \AA}$ ;  $R$  factor = 0.044;  $wR$  factor = 0.148; data-to-parameter ratio = 44.9.

The title zinc complex,  $[\text{Zn}(\text{C}_8\text{H}_8\text{NO}_2)_2(\text{C}_6\text{H}_6\text{N}_2\text{O})_2]$ , is composed of two monodentate 4-(methylamino)benzoate and two monodentate nicotinamide ligands. The coordination around the Zn atom is distorted tetrahedral. The dihedral angles between the two benzene rings and the two pyridine rings are 78.30 (6) and 68.86 (5) $^\circ$ . In the crystal structure, intermolecular N—H $\cdots$ O hydrogen bonds link the molecules into an infinite three-dimensional network.

## Bis[4-(methylamino)benzoato- $\kappa O$ ]bis(nicotinamide- $\kappa N$ )zinc(II)

**Baş Tercan, Tuncer Hökelek, Özgür Aybirdi and Hacali Necefoğlu**

### S1. Comment

Transition metal complexes with biochemical molecules show interesting physical and/or chemical properties, through which they may find applications in biological systems (Antolini *et al.*, 1982). The structure–function-coordination relationships of the arylcarboxylate ion in Zn<sup>II</sup> complexes of benzoic acid derivatives may be changed, depending on the nature and position of the substituted groups on the benzene ring, the nature of the additional ligand molecule or solvent, and the medium of the synthesis (Nadzhafov *et al.*, 1981). Nicotinamide (NA) is one form of niacin, and a deficiency of this vitamin leads to loss of copper from the body, known as pellagra disease. Victims of pellagra show unusually high serum and urinary copper levels (Krishnamachari, 1974).

The structure determination of the title compound, a zinc complex with two methylaminobenzoate (MAB) and two nicotinamide (NA) ligands, was undertaken in order to determine the properties of the MAB and NA ligands and also to compare the results obtained with those reported previously.

The molecular structure of the title monomeric complex, containing two monodentate MAB and two monodentate NA ligands, is illustrated in Fig. 1. The coordination around the Zn atom is distorted tetrahedral (Table 1).

The near equalities of the C1—O1 [1.284 (2) Å], C1—O2 [1.248 (2) Å] and C9—O3 [1.278 (2) Å], C9—O4 [1.241 (2) Å] bonds in the carboxylate groups indicate delocalized bonding arrangements, rather than localized single and double bonds, as in the other zinc(II) complexes: bis(4-hydroxybenzoato- $\kappa O$ )bis(nicotinamide- $\kappa N$ )zinc(II) (Necefoğlu *et al.*, 2002) and diaquabis(*N,N'*-diethylnicotinamide- $\kappa N$ )bis(4-fluorobenzoato- $\kappa O$ )- zinc(II) (Hökelek *et al.*, 2007). This may be due to the intramolecular N—H···O hydrogen bonding of the carboxylate O atoms (Table 2).

The Zn atom is displaced out of the least-squares plane of the carboxylate groups (O1/C1/O2) and (O3/C9/O4) by -0.1070 (3) Å and -0.0967 (4) Å, respectively. The dihedral angles between the planar carboxylate groups (O1/C1/O2) and (O3/C9/O4) and the adjacent benzene rings, A (C2—C7) and B (C10—C15), are 7.92 (13) $^{\circ}$  and 6.60 (13) $^{\circ}$ , respectively. The dihedral angles between the two benzene rings, A and B, and the two pyridine rings, C (N1/C17—C21) and D (N3/C23—C27), are A/B = 78.30 (6) $^{\circ}$  and C/D = 68.86 (5) $^{\circ}$ . The benzene rings are oriented with respect to the pyridine rings at dihedral angles of A/C = 20.95 (5) $^{\circ}$ , A/D = 77.94 (6) $^{\circ}$ , B/C = 80.59 (5) $^{\circ}$  and B/D = 33.66 (6) $^{\circ}$ .

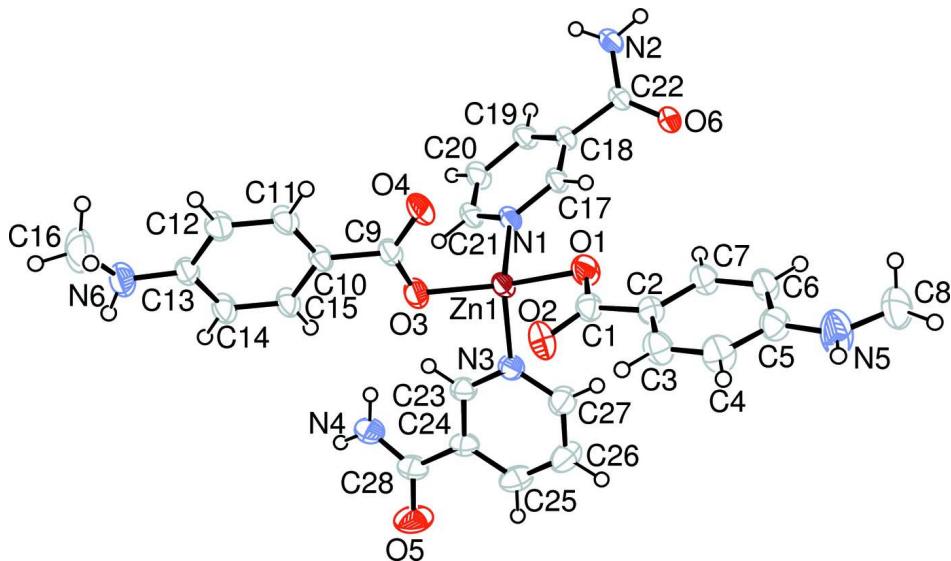

As can be seen from the crystal packing diagram (Fig. 2), the molecules are linked by intermolecular N—H···O hydrogen bonds to form an infinite three-dimensional network (Table 2).

### S2. Experimental

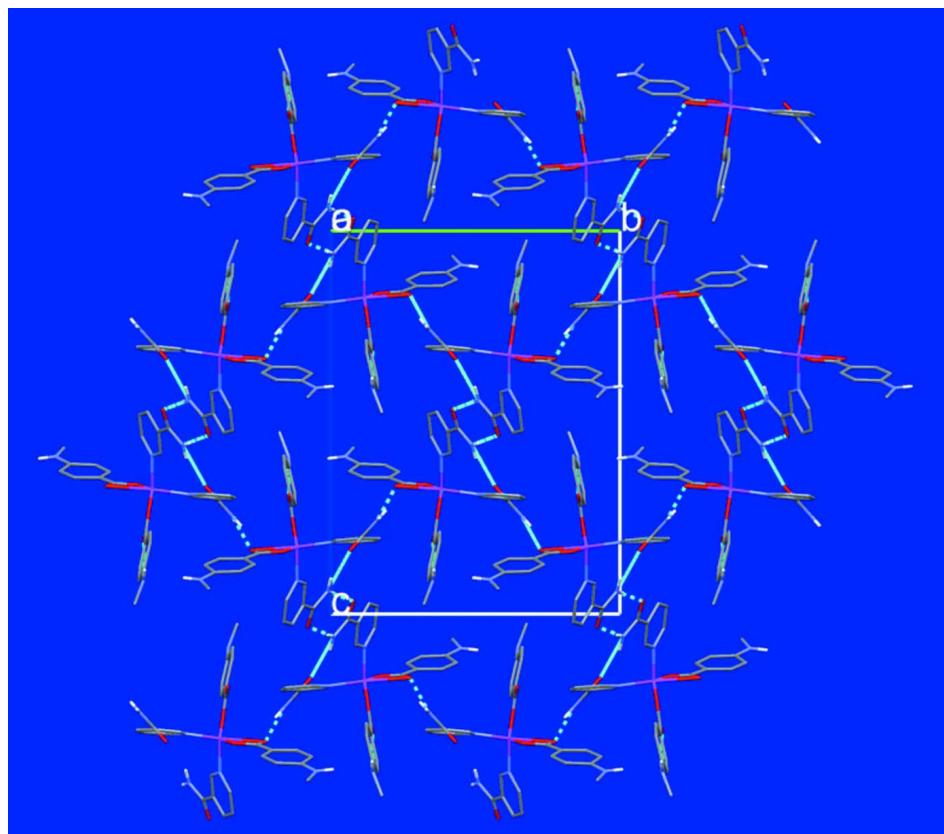

The title compound was prepared by the reaction of ZnNO<sub>4</sub> (1.61 g, 10 mmol) in H<sub>2</sub>O (25 ml) and nicotinamide (2.44 g, 20 mmol) in H<sub>2</sub>O (100 ml), with sodium 4-*N*-methylaminobenzoate (3.00 g, 20 mmol) in H<sub>2</sub>O (100 ml), at room temperature. The mixture was filtered and set aside to crystallize at ambient temperature for one week, giving colorless single crystals.

**S3. Refinement**

The NH H-atoms, H51 and H61, were located in difference Fourier maps and freely refined [N—H = 0.88 (2) and 0.90 (3) Å, respectively]. The remaining H atoms were positioned geometrically and treated as riding atoms: N-H = 0.86 Å, C-H = 0.93 - 0.96 Å, with  $U_{\text{iso}}(\text{H}) = 1.2$  or  $1.5U_{\text{eq}}(\text{parent N- or C-atom})$ .

**Figure 1**

The molecular structure of the title complex, with the atom-numbering scheme and displacement ellipsoids drawn at the 40% probability level.

**Figure 2**

A view down the *a* axis of the crystal packing of the title compound, showing the N-H $\cdots$ O hydrogen bonds (blue dashed lines) linking the molecules to form an infinite three-dimensional network (H atoms not involved in hydrogen bonding have been omitted for clarity).

 $w = 1/[\sigma^2(F_o^2) + (0.064P)^2]$   
where  $P = (F_o^2 + 2F_c^2)/3$   
 $(\Delta/\sigma)_{\max} = 0.003$   
 $\Delta\rho_{\max} = 0.67 \text{ e } \text{\AA}^{-3}$   
 $\Delta\rho_{\min} = -0.58 \text{ e } \text{\AA}^{-3}$

#### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
