Received 13 January 2009; accepted 13 January 2009

Key indicators: single-crystal X-ray study; $T = 120$ K; mean $\sigma(\text{C}-\text{C}) = 0.006$ Å; R factor = 0.061; wR factor = 0.146; data-to-parameter ratio = 15.2.

In the title compound, $\text{C}_{20}\text{H}_{15}\text{ClN}_2\text{OS}$, the bond lengths and angles in the thiourea group are typical of thiourea derivatives. The C–N bond lengths in the center of the molecule are shorter than the normal C–N single bond due to the resonance effects in this part of the molecule. The conformation of the title molecule with respect to the thiocarbonyl and carbonyl groups is twisted, as reflected by the C–N–C–O and C–N–C–N torsion angles of -4.4 (6) and -53.3 (5) $^\circ$, respectively. Pairs of the molecules are linked into centrosymmetric dimers, stacked along the c axis via intermolecular N–H···S interactions. There are also weak intermolecular C–H···O and C–H···S contacts in the structure.

3-Chloro-N-(diphenylcarbamothioyl)benzamide

Gün Binzet, Ulrich Flörke, Nevzat Külcü and Hakan Arslan

S1. Comment

Thioureas and their metal complexes are an important class of compounds with a wide range of biological applications such as antitubercular, antithyroid, anthelmintic, antibacterial, insecticidal and rodenticidal properties (Schroeder, 1955; Huebhr *et al.*, 1953; Madan *et al.*, 1991). Another area of the application of thiourea derivatives is analytical chemistry where some of these compounds have been used in the liquid-liquid extraction and separation of some transition metal ions (Koch, 2001).

Recently, a number of works on the structural and spectral properties of the thiourea derivatives and their metal complexes have appeared in the literature (Özer *et al.*, 2009; Mansuroğlu *et al.*, 2008; Uğur *et al.*, 2006; Arslan *et al.*, 2003c). We report here the crystal structure of one of them. The synthesis involves the reaction of a 3-chlorobenzoyl chloride with potassium thiocyanate in dry acetone followed by condensation of the 3-chlorobenzoyl isothiocyanate with the diphenylamine.

The molecular structure of the title compound, (I), is depicted in Fig. 1. The bond lengths and angles in the thiourea moiety are typical for thiourea derivatives; the C1-S1 (1.659 (3) Å) and C14-O1 (1.216 (4) Å) bonds both show typical double-bond character (Arslan *et al.*, 2003a, 2003b; Khawar Rauf *et al.*, 2009, 2006; Yamin & Yusof, 2003). The C–N bond lengths C14-N1 (1.388 (4) Å), C1-N1 (1.380 (4) Å) and C1-N2 (1.336 (4) Å) are shorter than the normal C–N single-bond length of about 1.48 Å. The shortening of these C–N bonds reveals the effects of resonance in this part of the molecule (Arslan *et al.*, 2003a, 2003b; Khawar Rauf *et al.*, 2009, 2006; Yamin & Yusof, 2003). The conformation of the title molecule with respect to the thiocarbonyl and carbonyl moieties is twisted, as reflected by the C1-N1-C14-O1 and C14-N1-C1-N2 torsion angles of -4.4 (6) ° and -53.3 (5) °, respectively.

The atom N2 is sp^2 -hybridized, because of the sum of the angles around atom N2 is 359.8 (3) °. The phenyl rings are rotated out of the mean plane of the N1-C1-S1-N2 atoms by 80.1 (2) ° (C2-C7 ring) and 69.96 (19) ° (C8-C13 ring). In addition, the dihedral angle between C2-C7 ring and C8-C13 ring is 72.8 (2) °.

As can be seen from the packing diagram (Fig. 2), intermolecular N–H···S hydrogen bond (Table 1) links the molecules into dimers, which are stacked along the *c*-axis. The other intermolecular contacts, C–H···O and C–H···S, are also listed in Table 1.

S2. Experimental

The title compound was prepared with a procedure similar to that reported in the literature (Arslan *et al.*, 2003a). A solution of 3-chlorobenzoyl chloride (0.01 mol) in acetone (50 cm³) was added dropwise to a suspension of potassium thiocyanate (0.01 mol) in acetone (30 cm³). The reaction mixture was heated under reflux for 30 min, and then cooled to room temperature. A solution of diphenylamine (0.01 mol) in acetone (10 cm³) was added and the resulting mixture was stirred for 2 h. Hydrochloric acid (0.1 N, 300 cm³) was added to the solution, which was then filtered. The solid product was washed with water and purified by recrystallization from an ethanol:dichloromethane mixture (1:2). Anal. Calcd. for

$C_{20}H_{15}ClN_2OS$: C, 65.5; H, 4.1; N, 7.6. Found: C, 65.4; H, 3.9; N, 7.7%.

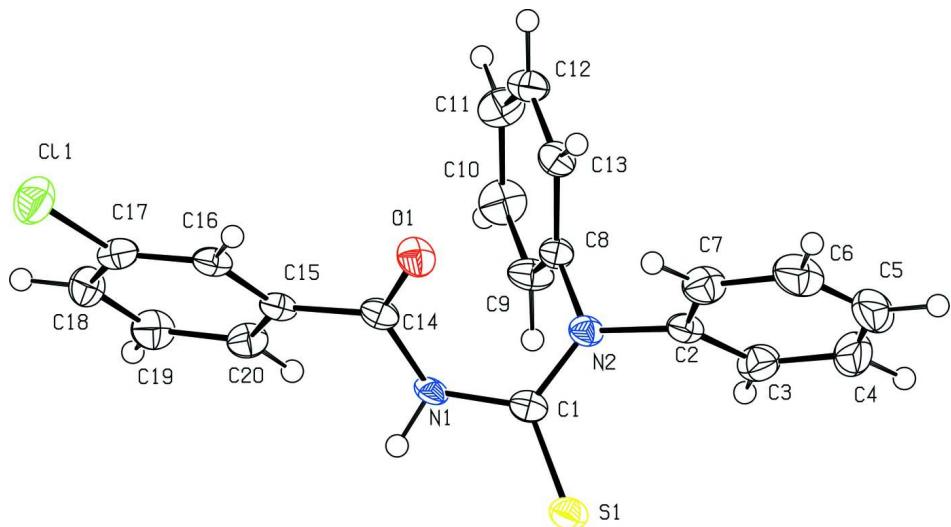

Figure 1

The molecular structure of (I). Displacement ellipsoids are drawn at the 50% probability level.

 $w = 1/[\sigma^2(F_o^2) + (0.0629P)^2]$
 where $P = (F_o^2 + 2F_c^2)/3$
 $(\Delta/\sigma)_{\max} < 0.001$
 $\Delta\rho_{\max} = 0.37 \text{ e \AA}^{-3}$
 $\Delta\rho_{\min} = -0.31 \text{ e \AA}^{-3}$

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F, with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R-factors based on ALL data will be even larger.
