Received 15 November 2008; accepted 31 December 2008

 Key indicators: single-crystal X-ray study; $T = 298$ K; mean $\sigma(\text{C}-\text{C}) = 0.007$ Å; R factor = 0.043; wR factor = 0.145; data-to-parameter ratio = 14.8.

The title compound, $[\text{Ca}(\text{C}_6\text{H}_3\text{ClNO}_2)_2(\text{H}_2\text{O})_2]_n$, contains polymeric chains extending along [100] that are generated by inversion centres. The Ca^{2+} ions are bridged by 2-chloronicotinate groups and exhibit an eight-coordination by six carboxylate O atoms of four different 2-chloronicotinate ligands and two O atoms of water molecules. In the crystal structure, intermolecular $\text{O}-\text{H}\cdots\text{O}$, $\text{O}-\text{H}\cdots\text{N}$ and $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds result in the formation of a supra-molecular network structure. The $\pi-\pi$ contacts between the 2-chloronicotinate rings [centroid-centroid distances = 3.875 (3) and 3.701 (3) Å] may further stabilize the structure.

S1. Comment

Chemistry of alkaline earth metals is an unexplored area. The model complexes containing Mg^{2+} and Ca^{2+} cations have previously been prepared and used as probes for understanding the binding modes of these metals (Schmidbaur *et al.*, 1989, 1990). In our ongoing studies with 2-chloronicotinate ligand and s-block metal ions, the title compound has been synthesized, and we report herein its crystal structure.

In the molecule of the title compound, (I), (Fig. 1), the bond lengths (Allen *et al.*, 1987) and angles are within normal ranges. It has an inversion centre midway between the two Ca^{II} ions, which are bridged by 2-chloronicotinate groups. Each Ca atom is eight-coordinated by six O atoms of 2-chloronicotinate ligands and two O atoms of water molecules. It essentially forms a one-dimensional chain structure (Fig. 2). The Ca—O bonds are in the range of [2.366 (3)–2.734 (3) Å] (Table 1). The average value of the Ca—O bonds [2.467 (3) Å] is almost the same with the corresponding values [2.4674 (9) Å] in $[Ca(3-aba)_2(H_2O)_2]_n$ (where 3-aba is 3-aminobenzoic acid), (II) (Murugavel & Banerjee, 2003) and [2.4556 (8) Å] in $[Ca(H_2O)_3Ca(1,3-pdta) \cdot (H_2O) \cdot 2(H_2O)]$ (where 1,3-pdta is the 1,3-propanediaminetetraacetate ion), (III) (Radanovic *et al.*, 2004). The $Ca1-Ca1^i$ [4.0553 (14) Å] and $Ca1-Ca1^{ii}$ [4.0681 (14) Å] [symmetry codes: (i) 1 - x, -y, 1 - z, (ii) 2 - x, -y, 1 - z] distances are longer than the corresponding value [4.0034 (5) Å] in (II).

In the crystal structure, intermolecular O—H \cdots O, O—H \cdots N and C—H \cdots O hydrogen bonds (Table 2) result in the formation of a supramolecular network structure. The π – π contacts between the 2-chloronicotinate rings, $Cg1-Cg1^i$ and $Cg2-Cg2^{ii}$ [symmetry codes: (i) -x, 2 - y, -z; (ii) 1 - x, 1 - y, 1 - z, where $Cg1$ and $Cg2$ are centroids of the rings A (N1/C2–C6) and B (N2/C8–C12), respectively] may further stabilize the structure, with centroid–centroid distances of 3.875 (3) Å and 3.701 (3) Å.

S2. Experimental

For the preparation of the title compound, $CaCl_2(H_2O)_2$ (0.588 g, 4 mmol) and 2-chloronicotinic acid (0.044 g, 0.4 mmol) were dissolved in H_2O (20 ml) and MeOH (30 ml) by refluxing for 30 min. Sodium methoxide (0.4 mmol, 0.8 ml) was added dropwise by stirring. After refluxing for 8 h, the colorless solution was obtained, and then filtered. The solvent was gradually removed by evaporation under vacuum until the colorless solid was obtained, which was recrystallized from petroleum ether–dichloromethane (1:1) to give the block-shaped colorless crystals.

S3. Refinement

H atoms were positioned geometrically, with O—H = 0.85 Å (for H_2O) and C—H = 0.93 Å for aromatic H, respectively, and constrained to ride on their parent atoms with $U_{iso}(H) = 1.2U_{eq}(C,O)$.

Figure 1

The molecular structure of the title molecule, with the atom-numbering scheme. Displacement ellipsoids are drawn at the 30% probability level.

Figure 2

A partial packing diagram of the title compound, showing the formation of the one dimensional chain structure.

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F , and R-factors based on ALL data will be even larger.
