Received 5 December 2008; accepted 15 January 2009

Key indicators: single-crystal X-ray study;  $T = 293$  K; mean  $\sigma(C-C) = 0.004$  Å;  $R$  factor = 0.033;  $wR$  factor = 0.097; data-to-parameter ratio = 17.5.

In the title compound,  $[Zn(C_{10}H_{11}N_2O_2)_2(C_5H_5N)_2]$ , the  $Zn^{II}$  atom lies on an inversion centre, and is coordinated in a distorted octahedral geometry by two carbonyl O atoms and two imino N atoms from two anionic bidentate acetone (2-hydroxybenzoyl)hydrazone ligands and by two N atoms from two pyridine molecules. The hydroxyl group acts as a donor, forming an intramolecular  $O-H \cdots N$  hydrogen bond.

**Comment**

Hydrazones have been attracting much attention by chemists in recent years because of their biological activities, chemical and industrial versatility, and strong tendency to chelate transition metals (Bai *et al.*, 2006; Grove *et al.*, 2004), lanthanide metals (Ma *et al.*, 1989) and main group metals (Gao *et al.*, 1998; Liu & Gao, 1998). In particular, salicyloylhydrazone can be very flexible and finely tuned at the molecular level to take versatile bonding modes. It can act as a bi-, tri-, tetra- and even pentadentate ligand. A number of zinc(II) complexes with salicyloylhydrazone ligands have been studied (Hu *et al.*, 2006; Hu *et al.*, 2007; Li *et al.*, 2006; Samanta *et al.*, 2007; Wu *et al.*, 2006). As an extension of the work on the structural characterization of salicyloylhydrazone complexes, the preparation and crystal structure of the title zinc(II) complex are reported here.

The molecular structure of the title compound is shown in Fig. 1. The Zn<sup>II</sup> atom lies on an inversion centre and has an axially elongated octahedral coordination geometry. The two carbonyl O atoms and the two imino N atoms make up the equatorial plane and the two N atoms of two pyridine molecules occupy the axial positions at longer distances (Table 1). Double-bond character is present in C7—N1 and C8—N2, as judged from their bond lengths [1.322 (2) and 1.286 (2) Å] (Domiano *et al.*, 1975; Liu *et al.*, 1999; Xiao *et al.*, 2000). The C7—O2 bond length of 1.273 (2) Å approaches the value of 1.263 Å expected for an enolic form of the hydrazone ligand (Chen & Liu, 2004; Wen *et al.*, 2000). The data suggest enolization and deprotonation of the hydrazone groups, which is different from the analogous Zn<sup>II</sup> complex with the same ligand (Li *et al.*, 2006). There exists an intramolecular O—H...N hydrogen bond (Table 2).

**Experimental**

All reagents were commercially available and of analytical grade. To a solution of Zn(CH<sub>3</sub>COO)<sub>2</sub>·2H<sub>2</sub>O (0.110 g, 0.5 mmol) in pyridine (5 ml) was slowly added a suspension of acetone-*N*-salicyloylhydrazone (0.192 g, 1.0 mmol) in DMF(5 ml). The resulting red solution was stirred for 20 min and then filtered. After standing for 5 d, yellow crystals were separated from the filtrate.

**Refinement**

H atoms bonded to C atoms were positioned geometrically and refined as riding atoms, with C—H = 0.93 (aromatic) and 0.96 (CH<sub>3</sub>) Å and with  $U_{\text{iso}}(\text{H}) = xU_{\text{eq}}(\text{C})$ , where  $x=1.2$  for aromatic and 1.5 for methyl H atoms. H atom of the hydroxyl group was located in difference Fourier map and refined isotropically with its coordinates fixed.

## Figures

Fig. 1. Molecular structure of the title compound. Displacement ellipsoids are drawn at the 30% probability level. Hydrogen bonds are shown as dashed lines. [Symmetry code: (i) 1 - x, -y, -z.]

### Refinement

Refinement on  $F^2$

Least-squares matrix: full

$R[F^2 > 2\sigma(F^2)] = 0.033$

$wR(F^2) = 0.097$

Secondary atom site location: difference Fourier map

Hydrogen site location: inferred from neighbouring sites

H-atom parameters constrained

$w = 1/[\sigma^2(F_o^2) + (0.058P)^2]$

where  $P = (F_o^2 + 2F_c^2)/3$

$S = 0.98$   $(\Delta/\sigma)_{\max} < 0.001$   
 3282 reflections  $\Delta\rho_{\max} = 0.38 \text{ e } \text{\AA}^{-3}$   
 188 parameters  $\Delta\rho_{\min} = -0.33 \text{ e } \text{\AA}^{-3}$   
 Primary atom site location: structure-invariant direct methods  
 Extinction correction: none

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
