Received 7 January 2009; accepted 6 February 2009

Key indicators: single-crystal X-ray study;  $T = 294$  K; mean  $\sigma(C-C) = 0.004$  Å; disorder in solvent or counterion;  $R$  factor = 0.020;  $wR$  factor = 0.044; data-to-parameter ratio = 18.7.

The title compound,  $[Ir(C_{12}H_8NO)Cl_2(C_{12}H_9NO)] \cdot CH_2Cl_2$ , which was obtained from the reaction of iridium(III) chloride trihydrate and 2-benzoylpyridine, contains an Ir<sup>III</sup> atom coordinated by two N, one O, one C and two Cl atoms in *trans* positions, forming a distorted octahedral environment. The solvent molecule  $CH_2Cl_2$  is disordered over two positions with an occupancy of 0.8:0.2.

## ***trans*-(2-Benzoylpyridine- $\kappa^2N,O$ )dichlorido[2-(2-pyridylcarbonyl)phenyl- $\kappa^2C^1,N$ ]iridium(III) dichloromethane solvate**

**Mao-Lin Hsueh and Cheng-Hsien Yang**

### **S1. Comment**

Several studies have been reported in cyclometallation of orthometallated ligands such as anionic ppy (ppyH is 2-phenylpyridine). For instance, Rh(Hbzpy)(bzpy)Cl<sub>2</sub> (bzpy is 2-pyridyl-2-phenonide) was obtained from the reaction of rhodium (III) chloride trihydrate with 2-benzoylpyridine (Hbzpy) in 2-methoxyethanol for 4 d at room temperature (de Geest & Steel, 1995). The orthometallated complex which they reported had a five-membered *N,O* metallacycle containing the chelated Hbzpy ligand and a six-membered *N,C* metallacycle containing the chelated bzpy ligand, on the basis of NMR chemical-shift analysis. Moreover, the structural study of the orthometallated Rh<sup>III</sup> complex was reported in order to make sure the stereochemistry (Tseng *et al.*, 2005). However, the synthesis and structural study of the according iridium complex was never reported. We report herein the synthesis and characterization studies of the title orthometallated Ir<sup>III</sup> complex, (I), containing 2-pyridyl phenone.

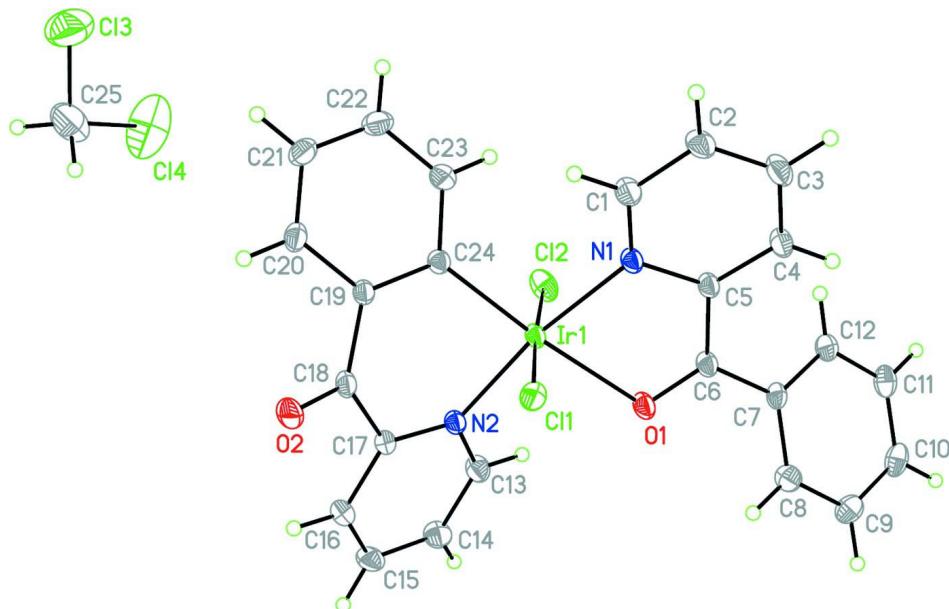

In the orthometallated title compound, the Ir atom is hexacoordinated by two equivalents of 2-benzoylpyridine, forming a pseudo-octahedral geometry, with two Cl ligands in a *trans* orientation. The pyridyl N atom of the Hbzpy ligand is *trans* to the N atom of the bzpy ligand, where one of the ligands is  $\kappa^2$ -(*N,C*)-cyclometallated and the other is  $\kappa^2$ -(*N,O*)-coordinated. Cyclometallation leads to a boat conformation, with atoms Ir and C18 above the N2—C17—C19—C24 plane (Fig. 1). The pyridyl ring of the Hbzpy ligand and the phenyl ring of the bzpy ligand are mutually stacked [C1—N1—C24—C23 = 48.8 (2) $^\circ$ ] (Table 1). The five-membered chelate ring deviates slightly from planarity [N1—C5—C6—O1 = -10.9 (3) $^\circ$ ] and is inclined to the phenyl plane [C5—C6—C7—C12 = -39.1 (4) $^\circ$ ]. There are no short intermolecular contacts.

### **S2. Experimental**

All procedures involving Ir(III) species were carried out under nitrogen gas atmosphere. 2-Benzoylpyridine (10.0 mmol) and 0.4 equiv. of IrCl<sub>3</sub>.H<sub>2</sub>O (Next Chimica) were heated in a 3:1 mixture of 2-ethoxyethanol and water. This slurry was heated to 100 °C for 24 hours. After cooling to room temperature, the precipitate was filtered off and washed with deionized water, followed by 2 portions of *n*-hexane and ether. The orange-reddish single crystals were obtained from the solutions of dichloromethane and *n*-hexane mixture (1:1) in 43% yield.

### **S3. Refinement**

All H atoms bonded to C atoms were placed in calculated positions, with C—H = 0.96 Å, and treated as riding atoms, with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ . The solvent molecule CH<sub>2</sub>Cl<sub>2</sub> was refined as disordered with an 80/20 occupancy for the two molecules.

*Special details*

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
