Received 5 February 2009; accepted 11 February 2009

Key indicators: single-crystal X-ray study; T = 295 K; mean σ(C–C) = 0.006 Å; R factor = 0.071; wR factor = 0.202; data-to-parameter ratio = 16.6.

In the title molecule, $C_{13}H_{13}ClN_2OS$, the heterocyclic ring adopts a flattened boat conformation, and the plane through the four coplanar atoms makes a dihedral angle of 87.92 (10)° with the benzene ring. The thione, acetyl and methyl groups have equatorial orientations with respect to the attached heterocyclic ring. The chlorophenyl group has an axial orientation. Intermolecular N—H···O, N—H···S and C—H···O hydrogen bonds are found in the crystal structure.

5-Acetyl-4-(4-chlorophenyl)-6-methyl-3,4-dihydropyrimidine-2(1*H*)-thione

N. Anuradha, A. Thiruvalluvar, K. Pandiarajan, S. Chitra and R. J. Butcher

S1. Comment

Dihydropyrimidin-2(1*H*)-ones are pharmacologically acitive as antioxidant agents (Stefani *et al.*, 2006). In recent years, much research has been focused on the synthesis of dihydropyrimidinones, which are important compounds due to their therapeutic and pharmacological properties. For example, they can serve as the integral of several calcium channel blockers (Rovnyak *et al.*, 1995; Atwal *et al.*, 1990), antihypertensive agents (Atwal *et al.*, 1991; Grover *et al.*, 1995). Recently, some marine alkaloids possessing dihydropyrimidine-5-carboxylate core have been shown to exhibit interesting biological activities such as potent HIV-gp-120-CD4 inhibitors as well as anti-HIV agents (Patil *et al.*, 1995). Dihydropyrimidin-2(1*H*)-thiones are also of much interest with regard to biological activity (Kappe, 1993).

In the title molecule, $C_{13}H_{13}ClN_2OS$, Fig.1., the heterocyclic ring adopts a flattened boat conformation, and the plane through the four coplanar atoms(C2,N3,C5 and C6) makes a dihedral angle of 87.92 (10)° with the benzene ring. The thione, acetyl and methyl groups have equatorial orientation, with the attached heterocyclic ring. The chlorophenyl group has an axial orientation. N1—H1···O15(1 + *x*, *y*, *z*), N3—H3···S2(2 - *x*, 1 - *y*, 1 - *z*) and C61—H61B···O15(1 + *x*, *y*, *z*) intermolecular hydrogen bonds are found in the crystal structure(Fig.2., Table 1).

S2. Experimental

A solution of acetylacetone (1.0012 g, 0.01 mol), 4-chlorobenzaldehyde (1.40 g, 0.01 mol) and thiourea (1.14 g, 0.015 mol) was heated under reflux in the presence of calcium fluoride (0.07 g, 0.001 mol) for 2 h (monitored by TLC). After, completion of the reaction, the reaction mixture was cooled to room temperature and poured into crushed ice. The solid product was filtered under suction and purified by recrystallization from hot methanol to gave the product in the pure form. Yield 1.02 g (90%).

S3. Refinement

H1 at N1 and H3 at N3 atoms were located in a difference Fourier map and refined isotropically. Remaining H atoms were positioned geometrically and allowed to ride on their parent atoms, with C—H = 0.93 - 0.98 Å and U_{iso}(H) = 1.2 - 1.5 times U_{eq}(C).

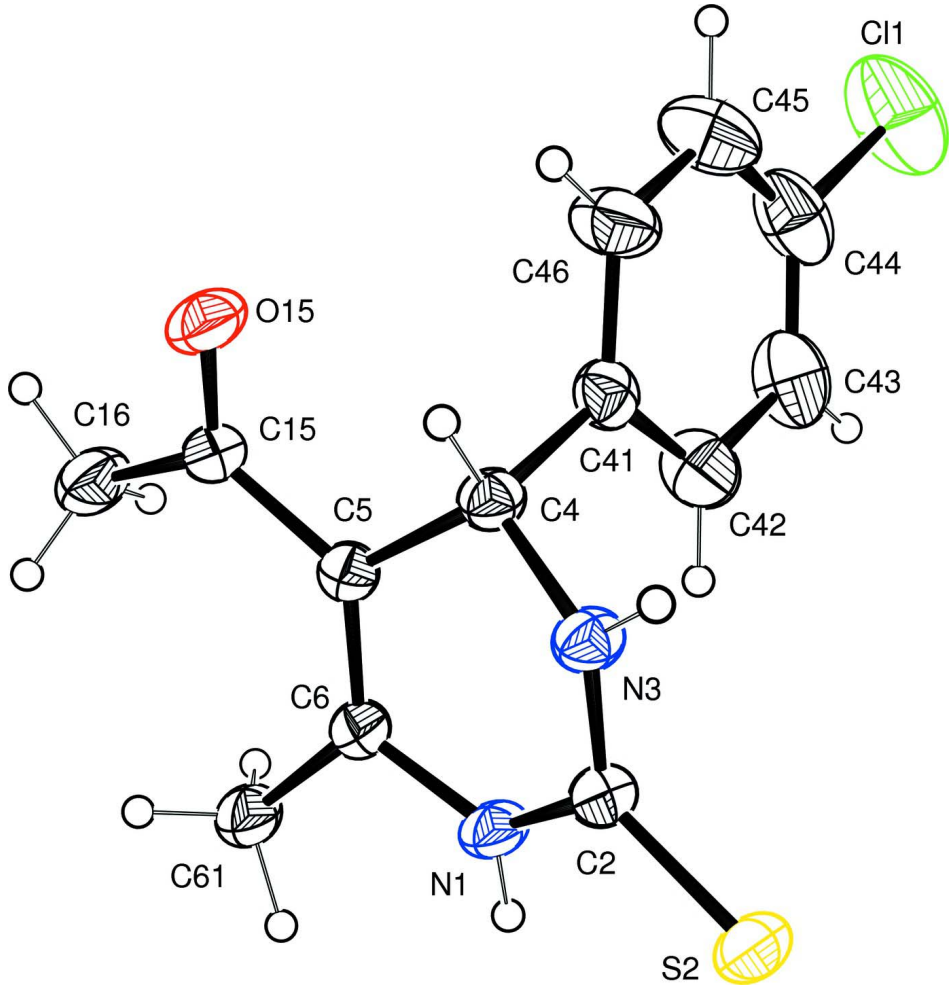

Figure 1

The molecular structure of the title compound, showing the atom-numbering scheme and displacement ellipsoids drawn at the 30% probability level. H atoms are shown as small spheres of arbitrary radius.

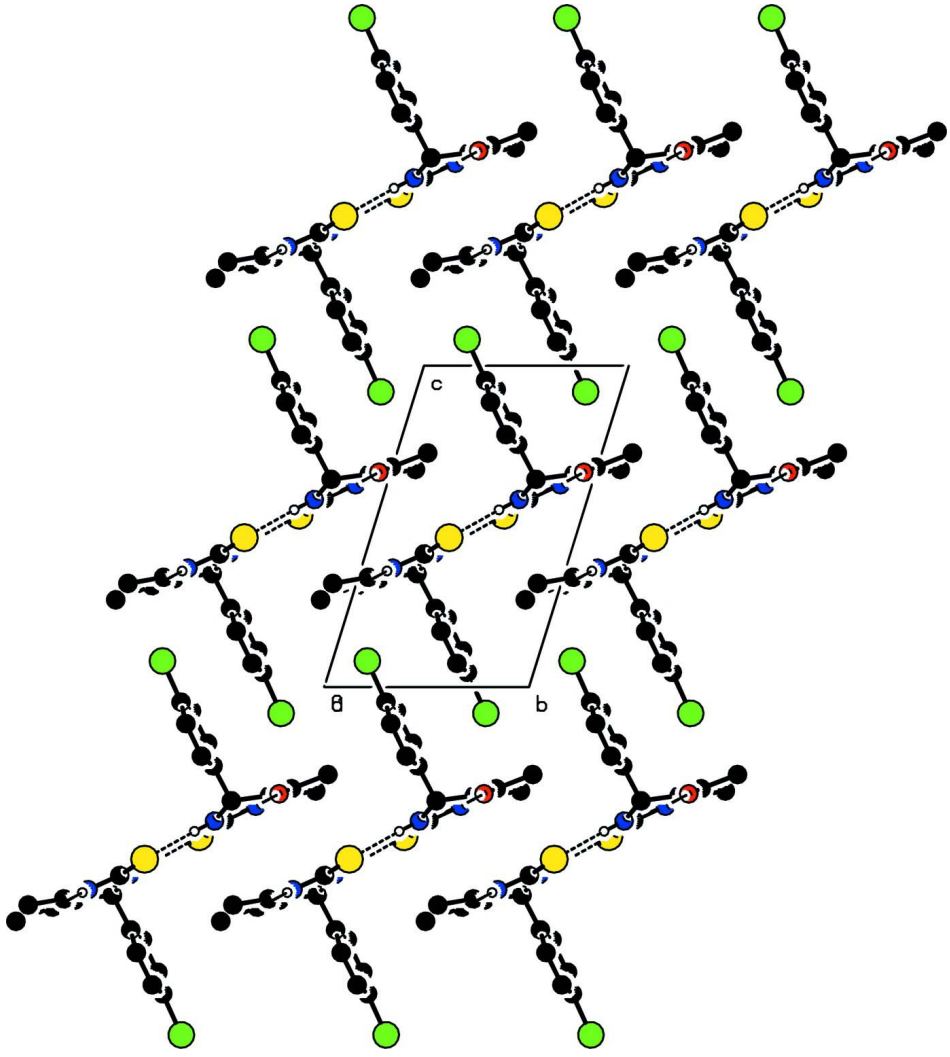

Figure 2

The packing of the title compound, viewed down the *a* axis. Dashed lines indicate hydrogen bonds. H atoms not involved in hydrogen bonding have been omitted.

Data collection

Oxford Diffraction Gemini R diffractometer
Radiation source: fine-focus sealed tube
Graphite monochromator
Detector resolution: 10.5081 pixels mm^{-1}
φ and ω scans
Absorption correction: multi-scan (*CrysAlis RED*; Oxford Diffraction, 2008)
T_{min} = 0.182, T_{max} = 1.000

6666 measured reflections
2878 independent reflections
2105 reflections with $I > 2\sigma(I)$
R_{int} = 0.036
θ_{max} = 77.4°, θ_{min} = 5.9°
h = −9→5
k = −10→9
l = −16→16

Refinement

Refinement on F^2
Least-squares matrix: full
$R[F^2 > 2\sigma(F^2)]$ = 0.071
$wR(F^2)$ = 0.202
S = 1.03
2878 reflections
173 parameters
0 restraints
Primary atom site location: structure-invariant direct methods
Secondary atom site location: difference Fourier map
Hydrogen site location: inferred from neighbouring sites
H atoms treated by a mixture of independent and constrained refinement
$w = 1/[\sigma^2(F_o^2) + (0.1275P)^2 + 0.1258P]$ where $P = (F_o^2 + 2F_c^2)/3$
$(\Delta/\sigma)_{max}$ = 0.001
$\Delta\rho_{max}$ = 0.53 e Å^{-3}
$\Delta\rho_{min}$ = −0.23 e Å^{-3}

Special details

Geometry. Bond distances, angles *etc*. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.
